ABSTRACT

To evaluate the effect of ethanolic extract of leaves of Moringa oleifera Lam. on acetic acid induced colitis in albino rats ethanolic extract of Moringa oleifera was prepared by percolation method. Acute toxicity test was done by using OECD guidelines. Albino rats were divided into four groups (n=5). Group A and B received 3% gum acacia. Group C and D received ethanolic extract of Moringa oleifera (EMO) 500 mg/kg BW and 5-aminosalicylic acid (5-ASA) 100 mg /kg BW respectively. Colitis was induced by transrectal administration of 4% acetic acid on 5th day. All animals were sacrificed after 48 hour of colitis induction and distal 10 cm of the colon was dissected. Colon was weighed for disease activity index (DAI) and scored for histopathological study. Biochemical assessment of tissue myeloperoxidase (MPO), catalase (CAT) and superoxide dismutase (SOD) was done in colonic tissue homogenate and malondialdehyde (MDA) was estimated in serum. Moringa oleifera showed significant (p=0.05) reduction in DAI, macroscopic and microscopic lesion score as well as significant (p<0.05) improvement in MPO, MDA, CAT, and SOD level as compared to Group B. The ethanolic extract of leaves of Moringa oleifera showed significant amelioration of experimentally induced colitis, which may be attributed to its anti-inflammatory and antioxidant property.

Keywords: Colitis, Moringa oleifera, antioxidant.

INTRODUCTION

Inflammatory bowel disease (IBD) comprises Crohn's disease (CD) and ulcerative colitis (UC) which are defined as chronic and relapsing inflammations of the gastrointestinal tract caused by variable pathophysiological mechanisms characterized by clinical manifestations including diarrhoea, blood in the stool, abdominal pain, and weight loss1. Despite the fact that aetiology of IBD still remains poorly understood, complex interactions among genetic, environmental, immunological and reactive oxygen species (ROS) have been implicated in the pathogenesis of IBD2. In many studies, it has been reported that antioxidants show beneficial effects on experimental colitis3-5.

Moringa oleifera Lam. (Assamese- Sajina, Hindi-Soanjna) is the most widely cultivated species of a monogenic family, the Moringaceae, that is native to the sub-Himalayan tracts of India, Pakistan, Bangladesh and Afghanistan. It is a perennial softwood tree with timber of low quality, but which for centuries has been advocated for traditional medicinal and industrial uses. All parts of the Moringa tree are edible and have long been consumed by humans. It is reported to contain alkaloids, flavonoids, anthocyanins, procyanidins and cinnamates. Leaves contain - Glycoside niazirin, niazirin , 4-[4'-O-acetyl- α -L-rhamnopyranosyloxy] benzyl isothiocyanate, niazimin A and B 14-15 , pterygospermin, 4-[4'-L- rhamnopyranosyloxy] benzyl glucosinolate and carotenoids (including β-carotene or pro-vitamin A) 7. Traditionally it is used in the treatment of Influenza, fever, giddiness, nervous debility, pain, and weight loss. Despite the fact that aetiology of IBD still remains poorly understood, complex interactions among genetic, environmental, immunological and reactive oxygen species (ROS) have been implicated in the pathogenesis of IBD2. In many studies, it has been reported that antioxidants show beneficial effects on experimental colitis3-5.

As the leaves of Moringa oleifera possess anti-inflammatory and antioxidant properties, this study has been undertaken to evaluate the effect of Moringa oleifera in experimentally induced IBD and to find its probable mechanism of action including its antioxidant potential.

MATERIALS AND METHODS

Drugs and chemicals

5-ASA and acetic acid were obtained from Merck Limited, Shiv Sagar Estate 'A', Dr. Annie Besant Road, Worli, Mumbai. The reagents for estimation of MPO and SOD were obtained from Sigma Pvt. Limited, Bangalore, India. Thiobarbituric acid was obtained from HiMedia Laboratories Pvt. Limited, Mumbai, India. Malondialdehyde bis was obtained from Merck Schuchardt OHG, Hohenbrunn, Germany.

Preparation of the extract

Approximately 1 kg of fresh tender leaves of Moringa oleifera collected during April–May was used for the study. The plant was authenticated by Dr. M. Islam, Professor of Life Science, Dibrugarh University, Assam, India. The plant material was air-dried at room temperature. The dried leaves were ground to a fine powder and stored in an air tight container.

Two hundred and fifty grams of the dry powder obtained was soaked in 95% ethanol for 24 hours in a percolator. After 24 hours, it was allowed to percolate slowly and the extract was collected in Petri dishes. The extract was concentrated in vacuum using a rotary flash evaporator. There was a net yield of 22.6 g of the concentrated extract (9.12%).

Animals

The experiments were carried out in albino rats of the species Rattus norvegicus of either sex weighing 150–200 g. The study was approved by the Institutional Animal Ethical Committee (Registration no.-634/02/a/CPCSEA). The animals were acclimatized for 1 week under laboratory conditions. They were fed with standard diet, and water was provided ad libitum.

Acute Toxicity Studies

Acute oral toxicity test for the ethanolic extract of leaves of Moringa oleifera was carried out as per Organization for Economic Cooperation and Development (OECD) Guidelines 425. One arbitrary doses of 500 mg/kg was selected for the study, as the extract was found safe even at doses more than 2000 mg/kg without any sign of toxicity or mortality.

Experimental Design

Twenty healthy albino rats of the species R. norvegicus, weighing 150–200 g, were used in the study and were divided into four groups with five animals in each group (n=5) as follows:

- Group A (normal control) – received 3% gum acacia 10 ml/kg/day p.o.
- Group B (experimental control) – received 3% gum acacia 10 ml/kg/day p.o.
- Group C – received 3% gum acacia 10 ml/kg/day p.o. + 5-ASA 500 mg/kg BW p.o.
- Group D – received 3% gum acacia 10 ml/kg/day p.o. + ethanolic extract of leaves of Moringa oleifera 500 mg/kg BW p.o.
• Group C (test) – received ethanolic extract of *Moringa oleifera* (EMO) 500 mg/kg/day p.o.
• Group D (standard) – received 5-amino salicylic acid (5-ASA) 100 mg/kg/day p.o.

**Induction of colitis**

The experiment was performed using acetic acid for inducing colitis. All the animals were pre-treated with the respective drugs (volume of drugs was kept constant at 5 ml/kg) for 5 days, along with the normal diet. On the fifth day, animals were fasted for 12 hours (overnight) and IBD was induced the next morning in Groups B, C and D by administration of 1 ml of 4% acetic acid solution transrectally (TR). Group A (normal control) received 0.9% normal saline TR instead.

IBD induction was done using an 8-mm soft paediatric catheter which was advanced 6 cm from the anus under low-dose ether anaesthesia. Rats were in Trendelenburg position during this process and 1 ml of 4% acetic acid or 0.9% normal saline solution was slowly administered TR. The rats were maintained in head-down position for 30 seconds to prevent leakage. After this process, 2 ml of phosphate buffer solution of pH 7 was administered TR.

All the animals were sacrificed after 48 hours of IBD induction, by ether overdose. Abdomens were opened and colons were exposed. Distal 10 cm of colon was excised and opened by a longitudinal incision. After washing the mucosa with saline solution, mucosal injury was assessed macroscopically using the scale of Morris et al. \[no damage (score 0); localised hyperaemia but no ulceration (score 1); linear ulcer without significant inflammation (score 2); linear ulcer with significant inflammation at one site (score 3); two or more sites of ulceration and inflammation (score 4) and two or more sites of ulceration and inflammation or one major site of inflammation and ulcer extending >1 cm along the length of colon (score 5). Disease activity index (DAI) was also measured, and the ratio of colon weight to body weight, which was used as a parameter to assess the degree of tissue oedema and reflects the severity of colonic inflammation, was measured.

A 6–8 mm sample block of the inflamed colonic tissue with full thickness was excised from a region of grossly visible damage for biochemical analysis. Formalin-fixed tissue samples were embedded in paraffin and stained with haematoxylin–eosin (HE). Colonic tissues were scored for histological damage using the criteria of Wallace and Keenan: 0 = intact tissue with no apparent damage; 1 = damage limited to surface epithelium; 2 = focal ulceration limited to mucosa; 3 = focal transmural inflammation and ulceration; 4 = extensive transmural ulceration and inflammation bordered by normal mucosa; 5 = extensive transmural ulceration and inflammation involving entire section.

**Biochemical Assessments**

**Preparation of the sample**

The proximal 5 cm of the dissected colon specimen was used for biochemical analysis of *Moringa oleifera* (EMO), tissue catalase (CAT) and superoxide dismutase (SOD). The colonic samples were minced and homogenised using a Polytron homogenizer. The supernatant was obtained by centrifuging at 3000 rpm for 20 minutes.

**Myeloperoxidase (MPO) activity**

The minced colonic samples were homogenised in 10 ml of ice-cold 50 mM potassium phosphate buffer (pH 6) containing 0.5% hexadecyl trimethyl ammonium bromide (HETAB). The homogenates were then sonicated and centrifuged for 20 minutes at 12,000 rpm. MPO activity was measured spectrophotometrically as follows. Exactly 0.1 ml of supernatant was combined with 2.9 ml of 50 mM phosphate buffer containing 0.005% H2O2. The change in absorbance was measured spectrophotometrically at 460 nm. One unit of MPO activity is defined as the change in absorbance per minute at room temperature in the final reaction. MPO activity (U/gm) = X/V/weight of the piece of tissue taken, where X=10-change in absorbance per minute/volume of supernatant taken in the final reaction.

**Malondialdehyde (MDA) level**

MDA was estimated by Sathok \[method 2\]. 75 mg of Triohobarbituric acid (TBA) was dissolved in 15% TCA to this 2.0 ml of 0.2 N HCl was added, the volume was made up to 100 ml using 15% TCA. 3.0 ml of this reagent was added to 0.75 ml of serum of the rats. The test tubes were kept in a boiling water bath for 15 minutes. They were cooled and centrifuged for 10 minutes at 1000 rpm. Absorbance of the supernatant was read against the blank at 535 nm.

The results were expressed in nmol/ml of serum.

**Assessment of antioxidant status in colonic tissue**

CAT was measured by the method of Beers and Sizer. Phosphate buffer (2.5 ml, pH 7.8) was added to the supernatant and incubated at 25°C for 30 minutes. After transferring into the cuvette, the absorbance was measured at 240 nm spectrophotometrically. Hydrogen peroxide (650 μl) was added and change in absorbance was measured for 3 minutes. Values were expressed as μmol/min/mg of proteins.

SOD was assayed according to the method of Kakkar \[et al. 23\]. The colonic samples were ground with 3.0 ml of potassium phosphate buffer, centrifuged at 2000 rpm for 10 minutes and the supernatants were used for the assay. The reaction was initiated by the addition of 0.2 ml of NADH to the mixture and incubated at 30°C for 90 seconds and arrested by the addition of 1.0 ml of glacial acetic acid. The reaction mixture was then shaken with 4.0 ml of n-butanol, allowed to stand for 10 minutes and centrifuged. The intensity of the chromogen in the butanol layer was measured at 560 nm in a spectrophotometer. One unit of enzyme activity is defined as the amount of enzyme that gave 50% inhibition of NBT reduction in one minute.

**Statistical Analysis**

For all the above methods, the results were expressed as mean±SEM. Statistical analysis was done using one-way analysis of variance (ANOVA), followed by Dunnet’s. *P<0.05* was considered significant.

**RESULTS**

**Acute Toxicity Studies**

There was no mortality among the animals. So the LD50 was calculated more than 2000 mg/kg body weight.

As observed from this study, acetic acid administration to the experimental control group caused significant macroscopic ulcerations and inflammations (*P<0.05*) in rat colon along with significant mucosal injury macroscopically (*P<0.05*), when compared to the normal control group [Table 1, Figures 1 and 2]. Also, there was significant derangement of biochemical parameters including tissue levels of MPO, MDA, CAT, SOD and serum MDA (*P<0.05*), indicating oxidative stress due to colon damage and colonic inflammation [Table 2].

Ethanolic extract of *Moringa oleifera* leaves has shown significant activity against experimentally induced IBD when compared to that of the experimental control (*P<0.05*) animals, with an improved picture of colon architecture both macroscopically as well as...
Das et al.

Microscopically [Table 1, Figures 2 and 3]. There is reduction of oxidative stress with significant improvement in tissue levels of CAT, SOD (P<0.05), showing its antioxidant potential [Table 2]. There is also significant improvement in the levels of MPO, showing its potential anti-inflammatory activity (P<0.05) [Table 2].

Values expressed as mean±SEM (n=5). *P<0.05 when compared to normal control; **P<0.05 when compared to experimental control.

ANOVA followed by Dunnet’s test;

As for the standard drug 5-ASA, its activity against IBD was significantly better than that of Moringa oleifera extract with regard to all the parameters (P<0.05). The 5-ASA showed near normalisation of DAI and macroscopic and microscopic score as compared to normal control [Table 1, Figure 4].

Discussion

Acetic acid induced colitis model is similar to human ulcerative colitis in terms of histological features. It affects the distal colon portion and induces non-transmural inflammation, massive necrosis of mucosal and submucosal layers, mucosal oedema, neutrophil infiltration of the mucosa and submucosal ulceration. The protonated form of the acid liberates protons within the intracellular space and causes massive intracellular acidification resulting in massive epithelial damage. Inflammation is the pathogenesis of IBD, and several pathways are associated with inflammatory response in IBD due to mucosal intestinal flora. The inflammatory response initiated by acetic acid includes activation of cyclooxygenase and lipooxygenase pathways.

The results showed that ethanolic extract of fruit extract of Moringa oleifera has got a significant protective activity against experimental colitis in rats, as indicated by DAI, macroscopic, microscopic and biochemical evaluations.

Myeloperoxidase (MPO) is an enzyme mainly found in azurophilic granules of neutrophils. It can serve as a good marker of inflammation, tissue injury and neutrophil infiltration in gastrointestinal tissues. Pretreatment with Moringa oleifera exhibits decrease in polymorphonuclear infiltration demonstrated by significant reduction in MPO activity. Oxidative damage may represent crucial pathogenic factor in IBD because intestinal inflammation is accompanied by increased production of reactive oxygen and nitrogen species.

MDA is considered as an important indicator of lipid peroxidation, which is found to be increased in rats treated with acetic acid. This might be due to lipid peroxidation. Pretreatment with Moringa oleifera showed protection against lipid peroxidation characterised by significant decrease in MDA level.

Oxidative stress is believed to play a key role in the pathogenesis of IBD-related intestinal damage. Intestinal mucosal damage in the IBD is related to both increased free radical production and a low concentration of endogenous antioxidant defence.
The antioxidant enzymes, mainly superoxide dismutase and catalase are first line defensive enzymes against free radicals and, ascorbic acid is also known to control oxidative damage. In the present study it was observed that the *Moringa oleifera* extract significantly increases antioxidant parameters (CAT and SOD) in colitis induced rats. This shows that the *Moringa oleifera* extract can reduce reactive free radicals that might lessen oxidative damage to the tissues.

In the present study, there is decrease activity of catalase (CAT) and superoxide dismutase (SOD) with the concomitant increase in malondialdehyde (MDP) concentration in the homogenized colonic tissue samples and serum MDA after acetic acid administration.

Present study shows that treatment with *Moringa oleifera* inhibits this decrease of CAT and SOD level and increase of MPO and MDA in rat treated with Acetic acid which may be because of protection against the progression of the disease.

The leaves of *Moringa oleifera* are rich in flavonoids. Flavonoids are phenolic substances which have antioxidant property. Further, previous studies have reported the protective action of flavonoids against oxidative stress induced cellular damage. The potent antioxidant activity of flavonoids may be their most important function, and underlies many of the above actions in the body. Flavonoids can exert their antioxidant activity by various mechanisms, e.g., by scavenging or quenching free radicals, by chelating metal ions, or by inhibiting enzymatic systems responsible for free radical generation. The antioxidant property also can be due to the presence of carotenoids, alcohols, proanthocyanidins in this plant. As proved by the above study and as also described in literature, leaf extract of *Moringa oleifera* possesses significant antioxidant property, proving its role in the management of experimentally induced IBD.
