ABSTRACT

A large number of efforts were made to synthesize different heterocyclic compounds and their derivatives in the past decade and were found to possess promising antitumor, anticonvulsant, antimicrobial, anti-tubercular and anti diabetic activities. Although benzothiazole moiety is very small but is fascinated by scientists because of the diverse biological activities by not only benzothiazole but its various substituted derivatives as well. This review was focused on the benzothiazole and its derivatives that are now in development.

INTRODUCTION

The practice of medicinal chemistry is devoted to the discovery and development of new agents for treating disease. The process establishing a new drug is exceeding complex and involves talent of people from variety of disciplines1. An important aspect of medicinal chemistry has been to establish a relationship between chemical structure and pharmacological activity 2.

It has been established that half of the therapeutic agents consists of heterocyclic compounds. The heterocyclic ring comprises of very core of the active moiety or the pharmacophore3.

They are also useful as antiallergic 8, antidiabetic 9, antitumor 10, anti convulsant 11, antifungal 12, antituberculosis 13, and antidiabetic agents.

Benzothiazole ring system consists of thiazole ring fused with benzene ring. Thiazole ring is a five-member ring containing one nitrogen and one sulfur atom in the ring system.

Several Benz-fused heterocyclic systems as Indole, Benzothiazole, Benzimidazole, Benzoxazole(fig.1) have been studied and found to be possessing interesting pharmacological activities such as antiviral 4, antibacterial 5, antifungal 5, and fungicidal activities 6. They are also useful as antiallergic 8, antidiabetic 9, antitumor 10, anti inflammatory 11, antihelmintic 12, and ant HIV agents 13.

Benzothiazole ring system consists of thiazole ring fused with benzene ring. Thiazole ring is a five-member ring containing one nitrogen and one sulfur atom in the ring system.

Benzothiazoles are bicyclic ring system with multiple applications. In the 1950s, a number of 2-aminobenzothiazoles were intensively studied as central muscle relaxants. Since then medicinal chemists have not taken active interest in this chemical family. Biologist’s attention was drawn to this series when the pharmacological profile of Riluzole 14(fig.2) was discovered.

The practice of medicinal chemistry is devoted to the discovery and development of new agents for treating disease. The process establishing a new drug is exceeding complex and involves talent of people from variety of disciplines1. An important aspect of medicinal chemistry has been to establish a relationship between chemical structure and pharmacological activity 2.

Several Benz-fused heterocyclic systems as Indole, Benzothiazole, Benzimidazole, Benzoxazole(fig.1) have been studied and found to be possessing interesting pharmacological activities such as antiviral 4, antibacterial 5, antifungal 5, and fungicidal activities 6. They are also useful as antiallergic 8, antidiabetic 9, antitumor 10, antituberculosis 13, and ant HIV agents 13.

Riluzole (6-trifluoromethoxy-2-benzothiazolamine), PK-26124, RP-25279, (Rilutek) was found to interfere with glutamate neurotransmission in biochemical, electrophysiological and behavioural experiments. After that, benzothiazole derivatives have been studied extensively and found to have diverse chemical reactivity and broad spectrum of biological activity.

Although they have been known from long ago to be biologically active, their varied biological features are still of great scientific interest.

In addition, benzothiazole ring is present in various marine or terrestrial natural compounds, which have useful biological properties. In last few years it was reported that benzothiazole, its bioisosters and derivatives had antimicrobial activity against Gram-negative, Gram-positive bacteria and the yeast Candida albicans and antimicrobial activity especially against Enterobacter, Pseudomonas aeruginosa, E.coli, and Staphylococcus epidermidis. Other activities involves are antidiabetic15, and bradykinin B2 receptor antagonist activity16. Given below is a brief account of various alterations conducted on benzothiazole ring and their associated biological activities.

1. ANTITUMOR ACTIVITY

The benzothiazole moiety with some substitution shows promising antitumor activity. Its aminomethylphenyl (1a), carboxinil (1b) and bis-amidino-substituted 2-styryl (1c) derivatives shows selective growth inhibitory properties against human cancer cell lines17, proliferation of cells18, cytostatisis19 respectively. Several chlorinated and fluorinated derivatives of this moiety exhibit excellent in vitro as well as in vivo antitumor activity.

Fluorinated analogues of 2-(4-aminophenyl) benzothiazoles have been synthesized which successfully block C-oxidation20. Fluorinated benzothiazole analogue 2-(4-amino-3-methylphenyl)-5-fluorobenzothiazole (SP203, NSC 703786) (1d) exhibit selective and potent anticancer activity. It is the favoured analogue for clinical consideration possessing enhanced efficacy in vitro and superior potencies against human breast and ovarian tumor xenografts implanted in nude mice Its lysylamide prodrug, (Phortress, NSC 710305), (1e) is under phase I clinical trials at the United Kingdom.

2. ANTI CONVULSIVE ACTIVITY

Role of benzothiazoles as anticonvulsive agents were first observed in 1978 against phenyltetrazolone induced convulsions on 2-(4-
arylthiosemicarbazidecarboxylnitrolylo) benzothiazoles23 (2a) and since then several benzothiazoles containing sulphonamide derivatives24 (2b), benzothiazoly guanidines25 (2c), benzothiazolamines26 (2d) were synthesized and evaluated for their activity against electron shock and penicillin induced seizures. The review of these literatures revealed the benzothiazole moiety as a dynamic agent against convulsive seizures.

A series of 2(3H)-benzoaxazolone and 2(3H)-benzothiazolone derivatives have been synthesized and evaluated for their anticonvulsant activity27. The compounds were assayed intraperitoneally in mice against seizures induced by maximal electroshock and pentylentetrazole. Compound 2e and 2f were the most active compound against Maximal Electroshock Seizures.

New sulphonamide derivatives having benzothiazole nucleus is synthesized for their anticonvulsant activity.28 halo/alkyl benzothiazoles with alkyl isothiocyanate29. The synthesized compounds were evaluated for their anticonvulsant activity.

3. ANTIMICROBIAL ACTIVITY

Microbes are causative agents for various types of disease like pneumonia, amebiasis, typhoid, malaria, common cough and cold various infections and some severe diseases like tuberculosis, influenza, syphilis, and AIDS as well. Various approaches were made to check the role of benzothiazole moiety as antimicrobial agent from the discovery of molecule to the present scenario. Various diaminophenyl sulfonyl29 (3a), Aryl-1,3,4-oxadiazol-5-yl-mercapto 30 methyl29 (3b), amino (substituted) acetonides30 (3c) aryldiene sulphonamide31 (3d) were synthesized in past decade and checked for their activity against various microbial stains like E. coli, S. aureus, S. typhi, P. aeruginosa, Bacillus subtilis, Candida albicans and Pneumococci, and found to possess promising antiviral, antiprotozoal, antifungal, and antibacterial activities.

A series of mult subsstituted benzoxazoles, benzimidazoles, and benzothiazoles had been synthesized (3e-3g), as non-nucleoside fused isosteric heterocyclic compounds and tested for their antibacterial activities against Staphylococcus aureus, Streptococcus faecalis, Bacillus subtilis as gram positive and E. coli, Klebsiella pneumoniae, Pseudomonas aeruginosa as gram negative bacteria and yeast Candida albicans using twofold serial dilution technique. The synthesized compounds possessed a broad spectrum of activity against the tested microorganisms at MIC values between 100 and 5.12 µg/ml. Benzothiazole ring system enhanced the antimicrobial activity against Staphylococcus aureus32.

Various 8-Fluoro-9-substituted (1,3)benzothiazol5(1-b)-2,4-trizoles (3h-3i) were synthetized and evaluated for antimicrobial activity against S.aureus, E.coli and C. Albicans33. All the compounds showed good antimicrobial activity. Some 6-fluoro-7-(substituted)-(2- N-p-anilinosulfonamido) benzothiazoles (R =nitroanilino, m-nitroanilino, p-nitroanilino, o-chloroanilino, m-chloroanilino, p-chloroanilino, anilino, morpholino, piperazin, dimethylamino) were synthesized and studied for their antibacterial and antifungal activities. All compounds showed moderate activity against S. aureus, S. albus and C.albicans34.

Latrofa et al.35 prepared a series of N-cycloalkylidine, N-cycloalkyl-2-cycloalkylidine-2,3-dihydro-1,3-benzothiazole and tested for in vitro antibacterial and antifungal activities against four gram positive and five gram negative bacteria. The findings obtained showed some of the tested compounds were effective against bacterial strains, whereas, only few compounds exhibited a moderate antifungal activity against the yeast strains evaluated.

The series of 2-benzylsulfanyl derivatives of benzoxazoles and benzothiazoles were synthesized by Koci et al36 and evaluated for their in vitro antimycobacterial activity against Mycobacterium tuberculosis and non tuberculous mycobacteria, and the activity was expressed as the minimum inhibitory concentration (MIC) in µM/L. The substances bearing two nitro groups or a thiomide group exhibited appreciable activity particularly against non-tuberculous strains.

In other words it can be stated that benzothiazole moiety serves as a royal warrior against almost all types of microbes.

4. ANTIINFLAMMATORY ACTIVITY

Pyrazolones and pyrazolines rank among the more venerable non-steroidal antiinflammatory agents. Phenylbutazone and its congeners incorporating a pyrazoline-3,5-dione structure are more potent antiinflammatory agents. In the recent years a number of Benzothiazole derivatives have been synthesized and found to display antinflammatory activity.

Oketani et al.37 studied the in vitro pharmacological profiles of 6-hydroxy-5,7-dimethyl-2-(methylymino)-4-(3-pyridyl)methyl)benzothiazoles (4a), against the 5-lipoxygenase activity of rat basophil leukemia cells. This result indicate that the compound potentially inhibits 5-lipoxygenase and thromboxane A2 synthetase and blocked thromboxane B2 production in rat peritoneal and human blood cells.

In the year 2003 a series of 2-[2-alkoxy-6-pentadecyl(phenyl)methylthio]-1H-benimidazole/benzothiazole has been reported (4b-4c) and investigated for their ability to inhibit human cyclooxygenase-2 enzyme (COX-2)38. Compounds were found to possess moderate anti inflammatory activity.

Dogruer et al.39 synthesized sixteen (2-benzoxazolone-3-yl and 2-benzoxazolone-3yl) acetic acid derivatives and tested them for antinoceptive and antiinflammatory activity. 4-[2-(6-Benzyl-2 benzoxazolone-3-yl) acetyl] morpholino, 4-[2-{2-(chloro benzoyl)-2-benzoxazolone-3-yl} acetyl] morpholino, 1-[2-5 chloro-2-benzoxazolone-3-yl] acetyl pyrrolidine, methyl (6 methyl-2-benzoxazolone-3-yl) acetate and N, N-diethyl-2- (benzothiazole-3-yl) acetamide have shown more potent antinociceptive activity than others.

2-(4'-butyl-5'-5'-dimethylpyrazol-1'-yl)-6-substituted benzothiazoles (4d) and 4'-butyl-1-(6'-substituted-2 benzothiazolyl)3'-methylpyrazol-5-ols (4e) have been synthesized by the condensation of 6-substituted-2-hydrizinobenzothiazoles with 3-butylpentane-2,4-dione and ethyl α-(n-butyl)acetoacetate respectively39. Selected compounds of the series were subjected to preliminary testing for their antiinflammatory activity. All the compounds belonging to series display significant antinflammatory activity.

5. MISCELLANEOUS ACTIVITIES

Srinivasan et al.40 have shown that the replacement of the urea moiety by benzothiazolesulfonyamide provided inhibitors of HIV-1 protease with improved potency and antiviral activities. Certain members of the class showed good oral bioavailability in rats.

Original derivatives of 2-piperazinyl benzothiazoles (5a) were synthesized and studied as mixed ligand for serotoninergic 5-HT1A and 5-HT3 receptors41. The studied compounds exhibited significant affinities for these two serotoninergic receptor subtypes. Compounds with such a pharmacological profile are of clinical relevance in the treatment of psychotropic diseases e.g. anxiety, depression and schizophrenia.

Das et al.42 prepared a series of structurally novel benzothiazoles based small molecule inhibitors of p56lck (a member of the Src family of non receptor protein tyrosine kinase). BMS-243117 (5b) is identified as a potent and selective Lck inhibitor with good cellular activity, whereas BMS-350751 (5c) and BMS-358233 (5d) are identified as potent Lck inhibitors with excellent cellular activities against T-cell proliferation.

Antileishmanial activity of synthesized (1,3- Benzothiazol-2-yl amine)-9-(10H)-acridine derivatives was tested by Florence Delmas et al.43. Two derivatives, 4-(6-nitro-benzothiazol-2-ylamino)-10H-acridin-9-one and 1-(6-amino-benzothiazol-2-ylamino)-10H-acridin-9-one (51c) showed moderate antileishmanial activity.

Nargund et al.44 have been synthesized a series of 8-fluoro-9 substituted (1,3)benzothiazole (5,1-b)-1,3,4-triazoles, and all compounds were screened for their Anthelmintic activity against earthworm, Peritum posthuma and were found to possess markedly higher Anthelmintic activity.

Riluzole (6- trifuoro methoxy- 2-benzothiazolamine) Patent No. - PK-26124, RP-25279 (Riluteck). Riluzole was found to interfere with neurotransmission in biochemical, electrophysiological and behavioural experiments.

CONCLUSION

The reviewed aminobenzothiazoles has shown a wide spectrum of biological activities. The substituted benzothiazolylimino dithiazolidines and the 2-{2'-aryl-1,3, 4-oxadiazol-5-yl}mercaptomethyl benzothiazoles are having significant antibacterial activity. Significant antiinflammatory activity is displayed by some new 2-{4'-butyl-3'-5'-dimethyl[pyrazol-1-y]-6'-substituted benzothiazoles and 4-butyl-1-{6'-substituted -2'-benzothiazolyl}-3-methyl[pyrazol-5-ones. Benzothiazolylguanidines are found to have potent activity. Potent antitumor activity was demonstrated by a number of 2-(4-aminophenyl) benzothiazoles. The 2-{4-acetamido-2-bromo-5-methylphenyl sulfonamide} benzothiazole is found to be effective as antituberculous agents, whereas ethozolamide and o-acyl
