ABSTRACT

A liquid chromatographic method was developed and validated for the simultaneous determination of ofloxacin and dexamethasone sodium phosphate in bulk and pharmaceutical formulations. Optimum separation was achieved in less than 5 min using a C_{18} column (250 mmx4.6 mm i.d, 5μ particle size) by isocratic elution. The mobile phase consisting of a mixture of mixed phosphate buffer (pH 4) and acetonitrile (50:50, v/v) was used. Column effluents were monitored at 236 nm at a flow rate of 1ml/min. Retention times of ofloxacin and dexamethasone sodium phosphate were 2.4 and 4 min respectively. The linearity of ofloxacin and dexamethasone sodium phosphate was in the range of 3-18 μg/ml and 1-6 μg/ml respectively. Developed method was economical in terms of the time taken and amount of solvent consumed for each analysis. The method was validated and successfully applied to the simultaneous determination of ofloxacin and dexamethasone sodium phosphate in bulk and pharmaceutical formulations.

Keywords: Simultaneous determination, HPLC, Isocratic elution, Validation

INTRODUCTION

Ofloxacin (OFN) is a second generation fluoroquinolone, broad spectrum antibiotic used in bacterial infections. It is chemically (RS) -7 –fluoro 2 –methyl -6 – (4 –methylpiperazin -1 –yl) -10 – oxo -1 –azatricyclo [7.3.1.0] trideca -5 (13), 6,8,11 –tetraene -11 –carboxylic acid. Dexamethasone sodium phosphate (DSP) is a highly selective glucocorticoid which is widely used in ocular inflammatory diseases. Its chemical name is 9- fluoro-11b, 17, 21-trihydroxy-16α- methylpregna-1, 4- diene-3, 20-dione 21-(dihydrogen phosphate) disodium salt[1]. Dexamethasone in combination with ofloxacin is used in several anti-infective eye preparations to treat acute and sub acute conjunctivitis, keratitis and corneal ulcers caused by susceptible strains of the following aerobic gram positive and negative bacteria such as S. aureus, S. epidermidis, S. pneumonia and haemophilus influenza[2].

In the literature, there are methods described for the individual estimation of fluoroquinolones and dexamethasone in aqueous samples and biological fluids by liquid chromatography[3- 5], liquid chromatography-fluorescence detection[6], UV- Visible spectroscopy[7]. A few methods have also been described for the simultaneous determination of Dexamethasone with other drugs such as Chloremphenicol[8], ciprofloxacin[9].

Methods were also described for simultaneous determination of ofloxacin with other drugs such as tetrazoline hydrochloride, tinidazole[10, 11], cefexime[12]. Simultaneous determination of OFN and DSP has been reported in the literature using a shimpack ODS column using a mixture of methanol citric acid solution (0 05mol/L), acetonitrile, ammonium acetate solution(0.5mol/L), 10g/L phosphoric acid solution (100:75:22:1:2) as mobile phase, the flow rate 1.0ml/min, and the detection wavelength being 242nm[13]. A number of reservations about the conditions used in this method and the mobile phase ratio and composition seem rather critical. The robustness of the method could therefore be significantly affected. So an attempt was made to develop a simple, robust HPLC method for the estimation of these drugs available as eye drops.

The purpose of the present study was to develop a simple, sensitive and economical HPLC method for simultaneous determination of OFN and DSP in bulk and pharmaceutical formulations. The developed method has been validated[14, 15] by evaluation of the system suitability, specificity, linearity, limit of detection and quantification, precision, accuracy and recovery. The validated method was applied to the commercially available pharmaceutical formulations containing both the drugs.

MATERIAL AND METHODS

Materials

DSP and OFN were obtained as gift samples from Ajanta pharmaceuticals Ltd, Mumbai. HPLC grade acetonitrile was purchased from SD fine chemicals, India. Triple distilled water was used during the study. The pharmaceutical formulations containing 3mg/ml of OFN and 1mg/ml DSP (Oflacin-DX eye/ ear drops, Microvision pharmaceuticals Ltd, India.) was purchased from local market.

Instrumentation

A high performance liquid chromatograph (Shimadzu-10 AT VP) equipped with two pumps (Model-10AT VP) and Shimadzu UV-Visible detector (SPD-10AT VP), ultrasonic bath **(**Spincotech Pvt. Ltd, India).

Chromatographic conditions

For chromatographic analysis, a Chromosil C18 column (250 mmx4.6 mm i.d, 5μ particle size) was used. Separation was carried out by isocratic elution. The mobile phase consisting of a mixture of mixed phosphate buffer (pH 4) and acetonitrile (ACN) in the ratio of 50:50, v/v was used. Mobile phase was filtered under vacuum from 0.45 membrane filter and degassed in ultrasonic bath for 30 min before passing through the instrument. The injection volume was 20μl and the flow rate was 1ml/min. UV detection was carried out at 236 nm. Chromatographic separations were carried out at room temperature (25-30°C).

Preparation of solutions

(a) Preparation of standard solution

Stock standard solutions of OFN and DSP were prepared in the mobile phase at a concentration of 600 μg /ml and 200μg/ml. working standard solutions was prepared by serial dilution of stock solutions with the mobile phase.

(b) Preparation of sample solution

Sample solutions of OFN and DSP were prepared at a concentration of 600 μg /ml and 200μg/ml by diluting 5 ml of the ophthalmic solution to 25 ml with the mobile phase. From this 0.25ml was taken and diluted to 10 ml to get a concentration of 15 μg /ml and 5 μg /ml of OFN and DSP respectively.

Method validation

The developed analytical method was validated as per ICH and USP guidelines for the parameters like linearity, limit of detection (LOD),

limit of quantification (LOQ), precision, specificity, accuracy, robustness, and system suitability.

Linearity

Six working standard solutions of each analyte in the concentration range of 3-18 µg/ml for OFN and 1-6 µg/ml for DSP were prepared in triplicate and injected. Calibration curves were constructed by plotting concentration versus mean peak area.

Limits of detection and Quantification

According to ICH, limit of detection (LOD) is the lowest concentration of the analyte that can be detected and limit of quantification (LOQ) is the lowest concentration of analyte that can be detected with acceptable accuracy and precision. LOD and LOQ are calculated from the formulae $3.3\sigma/s$ and $10\sigma/s$ respectively. Where σ is the standard deviation of y-intercepts of the regression line and s is the slope of the calibration curve.

Precision

The precision of the method was evaluated in terms of intermediate precision i.e., intra-day and inter-day precision and precision by different analysts. For intra-day precision three different concentrations of OFN and DSP in the linearity range was prepared in triplicate and was analyzed during the same day. For inter-day precision the same concentrations were analyzed on three consecutive days and RSD values were calculated. Instrument precision was analyzed by injection repeatability. This was examined by analyzing six injections of the mixture containing 15 and 5 µg /ml of OFN and DSP, respectively. RSD values were calculated from the peak areas and retention times of OFN and DSP.

Accuracy

Accuracy of the method was determined by recovery studies. These studies were carried out by addition of known amounts of OFN and DSP to a sample solution of known concentration and comparing calculated and measured concentrations. A sample solution containing OFN and DSP (0.6 and 0.2 mg/ml, respectively) was prepared by diluting 5 ml of the ophthalmic solution to 25 ml in a volumetric flask, and make up the solution with the mobile phase. Samples (0.1ml) of the filtered solution were transferred to 10 ml volumetric flasks containing 0.1, 0.15, and 0.2 ml of OFN and DSP standard solution, and analyzed.

Specificity

Specificity of an analytical method may be defined as the ability of the method to measure accurately and specifically the analyte in presence of additional components such as matrix, impurities, degradation products and other related substances. The chief excipient present in the eye drops is benzalkonium chloride which is used as preservative. Sample solution containing benzalkonium chloride was injected into the system and chromatogram was recorded.

Robustness

Robustness of the method was evaluated by deliberately varying method parameters such as detection wavelength and flow rate. Detection wavelength was changed from 236 nm to 236±2 nm and flow rate was changed from 1ml/min to 1±0.1ml/min. Effect of these changed parameters was studied by injecting the sample in to the system.

System suitability

System suitability was established in order to determine the adequate resolution and reproducibility of the proposed method. Suitability parameters including retention factor, resolution, asymmetry factor, plate number were investigated.

Assay of the marketed formulation

The developed method was applied to the simultaneous determination of OFN and DSP in pharmaceutical formulations. Sample was analyzed by performing six independent determinations and each series was injected in triplicate.

RESULTS AND DISCUSSION

Mobile phase optimization

Chromatographic parameters were optimized to develop a HPLC method for simultaneous determination of OFN and DSP with short analysis time (< 10 min), and acceptable resolution ($R_S>2$). Various compositions of mobile phases like methanol: buffer and ACN: buffer in different ratios were tried. But with mixed phosphate buffer (pH 4) and ACN in the ratio of 50:50 at a flow rate of 1ml/min, symmetrical peaks with good resolution were obtained. The optimum wavelength for detection was set at 236 nm at which better detector response for both drugs was obtained. The retention times were 2.4 and 4.0 min for OFN and DSP respectively (fig. 2).

Validation

Calibration graphs were constructed by plotting the peak area versus their corresponding concentrations. Good linearity was obtained in the range of 3-18 µg/ml and 1-6 µg/ml for OFN and DSP. The results are shown in table 1. Limit of detection (LOD) and limit of quantification (LOQ) were calculated from the slope and standard deviation of y-intercepts of the regression line of the calibration curve. For OFN it was found to be 0.0228 and 0.069 µg/ml and for DSP 0.008 and 0.024 µg/ml respectively. The precision of the method and instrument precision was evaluated and relative standard deviation (RSD) values were calculated. The RSD values for OFN and DSP showed that the precision of the method was satisfactory. The results are shown in table 2. The accuracy of the method was determined by recovery studies. The recoveries were close to 100% for OFN and DSP; the results are given in the Table 3. Developed method was found to be robust when the detection wavelength and flow rate was changed from 236 nm to 236±2 nm and 1ml/min to 1±0.1ml/min.

There was no considerable change in the peak areas and retention times. Using 0.9 ml/min flow rate, the retention time for OFN and DSP were found to be 2.71 and 4.45 min respectively and with 1.1 ml/min flow rate, retention times for OFN and DSP were found to be 2.23 and 3.74 min, respectively without affecting the resolution of the drugs. When detection wavelength was changed to 236±2 nm, the retention time for OFN and DSP were not changed from the normal. System suitability parameters are shown in table 4.

Table 1: Linearity by regression analysis (n=6)

Substance	R²	Slope	Conc. range(µg/ml)
OFN	0.9989	37.84	3-18
DSP	0.9995	39.8	1-6

'n' is number of determinations

Table 2: Precision expressed as %RSD

Parameters	OFN	DSP
Intra-day precision	0.42	0.49
Inter-day precision	1.21	0.68
Analyst precision	0.14	0.11
Injection repeatability for t_R	0.21	0.31
Injection repeatability for peak area	0.52	0.44

'n' is number of determinations and RSD is relative standard deviation

Table 3: Recovery studies (n=6)

Drug	Concentration µg/ml	Amount recovered µg/ml	%recovery	%RSD
OFN	12	12.03	100.21	0.47
	15	14.95	99.64	0.26
	18	18	99.99	0.56
DSP	4	3.99	99.85	0.46
	5	5.04	100.73	0.48
	6	6.05	100.77	0.86

'n' is number of determinations and RSD is relative standard deviation

Table 4: System suitability parameters (n=6)

Parameters	OFN	DSP
Retention time (t_R)	2.4	4.0
Asymmetry factor	1.64	1.36
Resolution	-	9.5
Number of plates	3684	7895
LOD (µg/ml)	0.0228	0.069
LOQ (µg/ml)	0.008	0.024

'n' is number of determinations

Assay of the marketed formulation

According to ICH in the case of assay, demonstration of specificity requires that the procedure is unaffected by the presence of impurities or excipients. The assay value of the marketed formulation was found to be within the limits. The low RSD value indicated suitability of this method for routine analysis of OFN and DSP in pharmaceutical dosage forms. Chromatogram of the sample shows that there was no interference from the excipients present in the formulation (Fig. 3); this indicates the specificity of the method. The results are shown in table 5.

Table 5: Assay of eye drops (n=6)

Drug	Label claim mg/ml	Amt found mg/ml	Mean %recovery	%RSD
OFN	3	3.02	100.9	0.36
DSP	1	1.00	100.7	0.98

Oflacin-DX eye/ ear drops containing 3mg/ml OFN and 1mg/ml DSP

Fig. 3: Typical chromatogram for the sample solution of OFN and DSP

CONCLUSION

The method described in this paper for the simultaneous estimation of OFN and DSP was found to be simple, sensitive, accurate, precise, rapid, robust and economical. The analytical conditions and the solvent system developed provided good resolution within a short analysis time. The RSD for all parameters was found to be within the limits, which indicates the validity of method and assay results obtained by this method are in fair agreement. Thus the developed method can be proposed for routine analysis of OFN and DSP in laboratories and for quality control purposes.
