ABSTRACT

The poor oral bioavailability of polyphenolic compound can be enhanced through the incorporation of them into phospholipid based self-assembled delivery system, i.e. popularly known as phytosome. "Phyto" means plants and "some" resembles a covering around/or a structure. Phytosome is generally prepared by reacting one or two moles of polyphenolic phytoconstituents and phospholipid. It may be either in the ratio of 1:1 and 1:2. By using phytosomes, one can also achieve enhanced rate and extent of the passage of lipophilic herbal constituents across lipid membrane that explains its character as a carrier as well as acid labile herbal drugs could also be protected in gastrointestinal tract. There are number of products available in the market that contains phytosomal drug delivery system such as Ginkgo biloba, Silybum marianum, and Camellia sinensis. The present review describes an updated overview of preparation of phytosomes, advancement in phytosomes technology, various herbal drugs for which phytosomes have been used as a carrier, its commercial availability and applications.

Keywords: Phytosomes, Novel drug delivery system, Phospholipid.

INTRODUCTION

Most of the biologically active constituents of plants are polar or water soluble but due to the problem in absorption, restricts the utilization of these type of compounds which ultimately decreases the bioavailability.

For improvement of bioavailability, herbal products must have proper homeostasis between hydrophilic (for absorption into gastrointestinal tract fluid) and lipophilic (to cross lipid bio membrane balance) [1]. Plant preparations are widely used in traditional as well as modern medicine system. During the traditional time, various pharmacological studies have been carried out with many plants extracts and their constituents to check their therapeutic application. Over the past year, great advancement has been made for the development of novel drug delivery system (NDDS) for various plant extracts and their active constituents. Novel drug delivery such as targeted drug delivery which directly channels the active entity on the site of action and such delivery system could offer targeted and sustained release of drug so that pharmacological effect could be achieved at lower dose. The development in the area of herbal medicine started earlier to cure human diseases with lesser side effects [2].

A number of chief constituents of herbal medicine are easily soluble in water (glycoside, flavonoid); however, these constituents are bounded in their potency because they may be partially soluble or hydrophobic in nature, so when applied topically shows less therapeutic efficacy [3]. Numerous efforts have been put forward to enhance the bioavailability of such drug by formulating them to target drug delivery system such as phytosomes and liposome's are good options. The use of these techniques in formulation development process may lead to good bioavailability of herbal drugs as compare to conventional herbal extracts.

Phytosomes means herbal drug loaded in vesicles, which is available in the nano form. The phytosome provide an envelope, like coating around the active constituent of drug and due to this the chief constituent of herbal extract remains safe from degradation by digestive secretion and bacteria. Phytosome is effectively able to absorb from a water loving environment into lipid loving environment of the cell membrane and finally reaching to blood circulation [4]. It can be used in the treatment of various fatal diseases without denaturing the active phytocompounds and enhanced bioavailability. Phytosomes are obtained by reacting phospholipid (either of natural or synthetic origin) with selected botanical constituents with an appropriate solvent, and due to their physical and chemical efficiency, these phytocomplex can be considered as a novel entity [5]. The current review highlights the future scope and emerging technologies in the field of NDDS for the benefit of herbal and traditional medicines prepared from plant origins.

PREPARATION OF PHYTOSOME

Phytosomes are generally prepared by adding accurate amount of phospholipid, i.e., Soya lecithin with herbal extracts in an aprotic solvent. Soya lecithin contains main constituent, i.e., Phosphatidylcholine which is having a dual function. Phosphatidyl part is lipophilic in nature and choline part is hydrophillic in nature. The choline part attached with hydrophilic chief active constituents, where as phosphatidyl part lipid soluble compound attached with choline bound complex. It results in the formation of lipid complex with better stability and bioavailability [6].

COMPARISON BETWEEN PHYTOSOME AND LIPOSOME

There is number of research has been carried out on phytosomes which state that phytosomes have good bioavailability, absorption, and excellent therapeutic efficacy over liposome. Comparison between phytosomes and liposomes is represented in Table 1 along with their structure in Fig. 1.

PHOSPHOLIPIDS [10]

Nowadays industrially produced phospholipid delivery system has a great role and becomes more popular. The main ingredients to achieve this goal is soya, chicken egg, etc. The main key ingredients in all this are phospholipid which comprises a glycerol unit joined with two fatty acids, and the remaining linkage is joined by a phosphate group. In phytosome preparation, the main phospholipid used as phosphatidylcholine having a great role in biological membrane and also
act as hepatoprotective. The molecular structure of Phosphatidylycholine is represented in Fig. 2.

COMMERCIAL PRODUCTS OF PHYTOSOMES [11-16]

There is numerous commercially available product based on Phytosomes are available in the market which is having great therapeutic role as compared to conventional dosage form. Some of them are listed along with their trade name, chief constituents, source, dose, and use in Table 2.

FLAVONOIDS USED IN THE PREPARATION OF PHYTOSOMES [17]

There are number of herbal chief constituents widely used in the preparation of phytosomes. Each active component having its own properties and therapeutic action. Some of important flavonoids are represented in Table 3 along with their source and molecular structure.

FUTURE PERSPECTIVE OF “SOMES” WITH THEIR APPLICATION

“Somes” are having a wide area of thrust, not only phytosome is having its property but there are some other “Somes” preparation also suggest their clinical efficacy which is represented in Table 4 along with their vesicular delivery system and application’s.

PROPERTIES OF PHYTOSOMES [41,42]

Physicochemical properties

a. Phytosomes are the complex between phytoconstituents and natural phospholipid, and the complex is obtained by reacting an appropriate amount of phospholipid and chief constituents in particular solvent.

b. The interaction between phospholipid and substrate is due to the development of hydrogen bonds between the polar head of phospholipid and the polar functionalities of the chief constituents.

c. On treatment with hydrophilic environment phytosome shows a cell-like structure like liposomes, but in a liposome, the chief constituent interacts within the internal pocket while in phytosome the chief active constituents are enveloped the polar head of phospholipid and becoming an integral part of the membrane.

d. The phytosome is a combination of few molecular complex which bounded together, while the liposome is a combination of number of phospholipids which react with chief constituent but without complete bonding with them.

**Biological properties**

a. Phytosome increases the active absorption of active ingredients and also increase the systemically bioavailability when administered orally.
b. These are the advance form of herbal products and having better efficacy as per compare to conventional herbal extract.
c. Phytosome has better pharmacokinetic as compare to simple herbal drugs.

d. **ADVANTAGE OF PHYTOSOMES [43]**

a. Phospholipid, i.e., phosphatidylcholine one of the valuable components of phytosome has a bifunctional activity by acting as a vehicle as well as health benefit such as hepatoprotective activity.
b. The absorption of hydrophilic active constituents is increased which also increase the efficacy.

c. As the efficacy increases the dosage requirement is also reduced.
d. Phytosomes have better stability.
e. Phytosome has the ability to permeate through skin due to its lipid layer around the phytoconstituent and thus enhance the effectiveness.
f. By increasing the solubility of bile to herbal origin phytoconstituents, phytosomes enhance the liver targeting[44].
g. Phytosome increase the solubility of bile to herbal constituents [45].
h. Time period of action is increased [46-48].

The advantage of phytosome is represented in diagrammatic form in Fig. 3 [49].

**MECHANISM OF PHYTOSOME TECHNOLOGY [50]**

The lower absorption and bioavailability of polyphenolic constituents mainly due to two factors. These chief constituents are number of ringed molecule and are not too much small that it will absorbed by diffusion process. Second factor is that flavonoid molecule or chief constituents of polyphenols have poor solubility with lipids. These are the limitations that inhibit their absorption through biological membrane. Phytosome

technology is mainly result with complexation of polyphenols with phospholipid in 1:1 ratio or 1:2 results in the formation of phytosomal complex with lipid covering around the constituents.

**PREPARATION TECHNIQUES FOR PHYRTOSMES**

a. Phytosome vesicles were made by thin layer rotary evaporator vacuum method. The phytosomal complex was mixed in anhydrous ethanol in 250 ml round bottom flask. The flask was attached to a rotary evaporator. The solvent will evaporate at a temperature about 60°C forming thin layer film around the flask. The film is hydrated by phosphate buffer having pH 7.4, and the lipid layer will peel off in phosphate buffer forming vesicle suspension. The phytosomal suspension was subjected to probe sonication with 60% amplitude. Phytosomal suspension will be stored in the refrigerator for 24 hrs, before characterization [51].

b. Phospholipid, i.e., soya lecithin was reacted with polyphenolic extract in an equal ratio with 5 mL of dichloromethane (DCM) with stirring until evaporate. Once the DCM was evaporated 5 mL of n-hexane, was added to the thin film with stirring and left in a fume hood for complete removal of the solvent. After complete removal of n-hexane, the thin film was hydrated and sonicated for desired phytosomal complex [52].

c. Weigh accurate amount of phospholipid and polyphenolic extract. Put it in 100 ml round bottom flask and reflux it with 30 mL of DCM on 60°C for 3 hrs, reduced it to 5-10 mL and add 30 mL of n-hexane with continuous stirring to get precipitate. Collect the precipitate and stored in a vacuum desiccator overnight. The dried precipitate is then passed through #100 mesh size and stored in well closed ambered colored container [53].

d. Phytosomes can be prepared by reflux method. Polyphenolic extract and phospholipid were placed in 100 mL round bottom flask and refluxed in DCM for 1 hr not exceeding 40°C. The clear solution was evaporated and add 15 mL of n-hexane until a precipitate was obtained. The precipitate was taken and placed in a desiccator [54].

e. Accurately, weight the quantity of phospholipid and cholesterol in round bottom flask and dissolve it in 10 mL of chloroform followed by sonication for 10 minutes using bath sonicator. Organic solvent removal can be done by subjecting it under reduced pressure in a rotary evaporator. The solvent will evaporate at a temperature about 40°C forming thin layer film around the flask. The film is hydrated by polyphenolic extract of the drug in a rotary evaporator. Phospholipid mixture was sonicated in an ice bath for heat dissipation. Prepared phytosome were stored in an ambered colored bottle [55]. The diagrammatic representation of procedure is shown in Fig. 4.

**CHARACTERIZATION TECHNIQUES OF PHYRTOSOME [56-58]**

**Differential scanning calorimetry**

Drug polyphenolic extract, phosphatidylcholine, a physical mixture of drug extract and phosphatidylcholine, and drug-phospholipid complex were placed in an aluminum cell and heated to a temperature of 50-250°C/minutes from 0 to 400°C in the atmosphere of nitrogen.

**Scanning electron microscopy (SEM)**

SEM was used to determine the size of the particle and its appearance. Dry sample was placed on electron microscope brass stub coated with gold in an ion sputter. Random scanning of the complex at 100.

**Transition electron microscopy (TEM)**

TEM was used to characterize the size of phytosomal vesicles with 1000 magnification.

**Drug entrapment and loading capacity**

Drug phytosomal complex was centrifuged at 10000 rpm for 90 minutes at 4°C to separate phytosome from the untrapped drug. The percentage drug entrapment can be calculated as given formula:

\[ \text{Entrapment efficiency} \% = \frac{\text{Weight of total drug} - \text{Weight of free drug}}{\text{Weight of total drug}} \times 100 \]

**Fig. 4: Preparation method for phytosomes**

**Fourier transform infrared spectroscopy (FTIR) analysis**

FTIR analysis will be done for checking the structure as well as chemical stability of drug, phospholipid. The phytosomal drug will be crushed with potassium bromide to obtain pellets at 600 kg/cm² pressure. Scanning will be done between the ranges of 4000-400 cm⁻¹.

**Size analysis and zeta potential**

Malvern Zetasizer is used to check the particle size and zeta size of phytosomal complex. Argon laser is used for this particle size and zeta sizer characterization.

**In vitro and in vivo evaluations**

**In vitro** evaluation will depend on the properties of the drug, their chief phytoconstituents bounded by phospholipid layer and on the bases of that particular animal model is selected for its evaluation.

**ADVANCES IN PHYRTOSOME TECHNOLOGY**

There are number of research articles reveals the importance of phytosomal delivery system over conventional herbal extract. Advances in phytosomal delivery system are as follows:

a. Bacopaside well-known chief constituents present in *Bacopa monnieri* plant having antiamnesic activity. This study is an attempt to prepare phytosome from bacopaside and its *in vivo* evaluation on rodents. There is remarkably great change in the therapeutic efficacy of the compound prepared by phospholipid as compare to simple *B. monnieri* extract [59].

b. Another study also reveals that there is the preparation of berberine phospholipid complex solid dispersion, which not only increase the solubility of the compound but also increase its flow ability and dissolution rate for industrial production [60].

c. Another research state that there is the preparation of singrin phytosome. The study was carried out for in vitro wound healing capacity and the result is also appreciable as compare to sinigrin alone [61].
d. One research reported silymarin phytosomes with better anthepatotoxic activity as compare to silymarin alone and also having great role for the protection against B1 aflatoxin on broiler chicks [62].
e. The phytosomes from standardizaed extract of seeds of S. marianum have administered orally which is having great effect on foetus from maternally ingested alcohol [64].
f. One clinical research reveals that the study of 232 patient with chronic hepatitis when treated with silybin phytosome at a dose of 120 mg twice or thrice a day up to 120 days having great role for recovery of liver function [63].
g. Grape seed phytosome also having great role in ischemia induced damage in the heart, also having protective against atherosclerosis. The main chief constituents responsible for this is proanthocyanidins/p-cyanidins [64].
h. Camellia sinsensis or the extract of green tea when incorporated in phytosomes having improved oral bioavailability as compared to uncomplexed green tea extract. Epigallocatechin 3-o-gallate is the main active constituents present in green tea [65-67].
i. Further clinical trial suggested that phytosomes of green tea free from caffeine also having a significant effect on anti obesity and antioxidant activity. Its also having effect on low-density lipoprotein [68-70].
j. Quercetin phytosomal complex reveals the better therapeutic property in rat liver injury induced by carbon tetra chloride [71].

**SOME PATENTED TECHNOLOGY OF PHYTOSOME**

There is numerous work has been done for commercialization of Phytosome, out of them few patents technology are representing in Table 5 along with their patent title, description of innovation and patent number.

**CONCLUSION**

Herbal products always have great concern of denaturation and bioavailability. There is so many novel approaches are available in the form NDDS. Despite these approaches liposomes and phytosomes are most suitable novel approaches for herbal drugs to overcome this kind of problems. These delivery systems have improved the pharmacotherapeutics and pharmacokinetics of herbal drugs. This kind of delivery systems is also utilized in the field of nutraceuticals and cosmeceuticals for improving therapeutic effect and permeability in the skin. The formation of phytosomes are simple and reproducible a part of that phospholipids used in the preparation of phytosomes have their own beneficial effects in the body.
