INTRODUCTION

In India, medicines based on herbal origin have been the basis of treatment and cure for various diseases. Moreover, Indian folk medicine comprises numerous prescriptions for therapeutic purposes such as healing of wounds, inflammation, skin infections, leprosy, diarrhoea, scabies, venereal disease, ulcers, snake bite. More than 80% of the world’s population still depends upon traditional medicines for various skin diseases. Herbal medicines in wound management involve disinfection, debridement and providing a moist environment to encourage the establishment of the suitable environment for the natural healing process. A large number of plants are used by folklore traditions in India for treatment of cuts, wounds and burns. The drugs selected for this work were *Acacia arabica* and *Butea monosperma*. These two important herbs are reported to have significant antibacterial, immunomodulatory and anti-inflammatory activities which are complementary to wound healing process. The growing popularity of natural and herbal medications, easy availability of raw materials, cost-effectiveness and their medicinal uses reported in the literature. The herbs (*Acacia arabica* and *Butea monosperma*) were purchased from the local area of city and authenticated by Taxonomist in the department of Botany, Shri Shivaji Science and Arts College, Chikhli. All other chemicals were of analytical grade and used without further purification.

MATERIALS AND METHODS

**Materials**

The plants were selected on the basis of their antimicrobial activities and their medicinal uses reported in the literature. The herbs (*Acacia arabica* and *Butea monosperma*) were purchased from the local area of city and authenticated by Taxonomist in the department of Botany, Shri Shivaji Science and Arts College, Chikhli.

**Methods**

For this purpose aqueous extract of bark were prepared by "Soxhlet extraction method". The experimentally induced burn wound model in rats by "Excision method".

**Results**

As a result of this study it was found that the extract of bark generally revealed antimicrobial and wound healing activity.

**Conclusion**

The result of the study suggest that the *Acacia arabica* and *Butea monosperma* bark of polyherbal gel effective in accelerating wound healing process.

**Keywords**

*Acacia arabica*, *Butea monosperma*, Wound Healing, Excision method, Soxhlet extraction, Polyherbal Formulation

**EVALUATION OF WOUND HEALING ACTIVITY OF POLYHERBAL FORMULATION**

**ABSTRACT**

**Objective:** The present study describes the anti-microbial activity of *Acacia arabica* and *Butea monosperma* bark extract.

**Methods:** For this purpose aqueous extract of bark were prepared by "Soxhlet extraction method". The experimentally induced burn wound model in rats by "Excision method".

**Results:** As a result of this study it was found that the extract of bark generally revealed antimicrobial and wound healing activity.

**Conclusion:** The result of the study suggest that the *Acacia arabica* and *Butea monosperma* bark of polyherbal gel effective in accelerating wound healing process.

**Keywords:** *Acacia arabica*, *Butea monosperma*, Wound Healing, Excision method, Soxhlet extraction, Polyherbal Formulation

Wound healing studies

A partial thickness burn wound model was employed as per [2]. The rats will be anaesthetized with diethyl ether and the hair on the back will be shaved with a sterile blade. The shaved area was disinfected with 70% (v/v) ethanol. Then burn wound will be created by pouring hot molten wax (2 gm) at (80 °C). The wax circular opening. The wax will be allowed to remain on the skin till it gets solidified. Immediately after injury and on subsequent days, all the gel will be daily applied topically for 21 d or till complete epitheliazation which ever will earlier. After animal recovered completely from anesthesia, they were kept in individual cages and followed all norms of good laboratory practice in carrying the animals [3]. The animals were randomly divided into 5 groups and each group containing 6 animals. The treatments of each gel (500 mg/rats) were applied topically once a day [4].

Group I: Control group.

Group II: Test group treated with Acacia Arabica gel. (Formulation I)

Group III: Test group treated with Butea monosperma gel. (Formulation II)

Group IV: Test group treated with (Polyherbal gel) (Formulation III)

Group V: (Reference Standard Marketed Preparation). Wound contraction will be monitored by measuring the progressive changes in row wound area, planmetrically on the transparent paper, from which the wound surface area will be evaluated. The tracing was then transferred to 1 mm² graph sheet, from which the wound surface area was evaluated. The evaluated surface area was then employed to calculate the percentage of wound contraction, taking the initial size of the wound, 300 mm², as 100% by using the following equation.

\[
\text{Wound Contraction (%) = } \frac{\text{Initial Wound Size} - \text{Specific day Wound Size}}{\text{Initial Wound Size}} \times 100
\]

Statistical analysis

Experimental data are expressed as mean± (SEM) standard error of mean. Statistical analysis was performed by using one way ANOVA followed by Dunnet test.

RESULTS AND DISCUSSION

The prepared herbal gel formulations incorporating herbal extracts i.e. Acacia Arabica and Butea monosperma extract are subjected for the in vitro evaluation and stability studies by using various parameters.

Wound contraction

Wound contraction is another parameter used to assess wound healing. Significant wound contraction was shown in table.

DISCUSSION

From the above remarks, it can be concluded that all the parameters of the selected herbs were within in the Pharmacopoeial limit indicates the high-quality quality of raw materials. The extract studies showed the presence of selected active constituents in significant amount. The microbiological studies indicated that the formulations possess anti-microbial activity against tested organisms. The wound contraction studies revealed that the wound contraction increases on increasing the concentration of herbal extract. The study also reveal that the better activity of polyherbal formulation may be due to the synergistic action of the plants constituents present in the formulation. Thus, the prepared topical gels possess a versatile approach in healing the wound contraction.

CONCLUSION

In pharmacological evaluation, Acacia arabica showed significant wound healing effect as compared to control group. Butea monosperma showed significant wound healing effects as compared control group. The polyherbal gel that is the combination of these two drugs showed synergistic wound healing activity as compared to all herbal drugs individual activity. The prepared herbal gel showed significant wound healing activity and the combination of
Acacia arabica, Butea monosperma had synergistic wound healing activity. In present study it is concluded that wound healing potential of polyherbal gel is better than individual gel i.e. Acacia arabica, Butea monosperma gel. In polyherbal gel there is the higher percentage of wound contraction. The present study is a platform and the work would go on a long a way in extracting the potential of Acacia arabica, Butea monosperma gel for the various activity.

ACKNOWLEDGEMENT

We are grateful to our principal Dr. K. R. Byani, Guide Prof. G. R. Sitaphale, Mr. M. A. Deshmukh, staff members, Director and Our honorable chairman Shri. R. S. Bondre for providing us necessary facilities to carry out the research project.
