ABSTRACT

The study includes phytochemical screening and quantification of primary and secondary metabolites like chlorophyll, carbohydrates, protein, lipids, phenol, tannin and flavonoids from Acacia arabica bark. For these purpose aqueous extract of bark was prepared by “Soxhlet extraction method”. The result of these study suggests that the Acacia arabica bark in which presence of primary and secondary metabolites.

Keywords: Phytochemical screening, Primary and Secondary metabolites, Acacia arabica bark

INTRODUCTION

Since ancient times, people have been exploring the nature particularly medicinal plants in search of new drugs. Medicinal plants are used by 80% of the world population for their essential health needs. India is the birthplace of the renewed system of indigenous medicines such as Siddha, Ayurveda and Unani. Traditional systems of medicines are prepared from a single plant or combinations of more than one plant. This efficacy depends upon the current knowledge about taxonomic features of plant species, plant parts and biological property of medicinal plants which in turn depends upon the occurrence of primary and secondary metabolites [1]. Plant synthesize a wide range of chemical compounds which are classified based on their chemical class, biosynthetic origin and functional groups into primary and secondary metabolites. Primary metabolites directly involved in growth and development while secondary metabolites are not involved directly and they have been worked as biocatalysts. Primary metabolites are widely distributed in nature, occurring in one form or another in virtually all organisms. They are like chlorophyll, amino acids, nucleotides, carbohydrates etc. which have a key role in metabolic processes such as photosynthesis, respiration and nutrient assimilation. They are used as industrial raw materials and food additives. The drugs selected for this work were Acacia arabica these is important herbs are reported to have significant antibacterial, immunomodulatory and anti-inflammatory activities which are complementary to wound healing process. The growing popularity of natural and herbal medications, easy availability of raw materials, cost-effectiveness and the paucity of reported adverse reaction [2].

MATERIALS AND METHODS

Materials

The plants were selected on the basis of their phytochemical screening, quantitative analysis of primary and secondary metabolites and their medicinal uses reported in the literature. The herbs (Acacia arabica) were purchased from the local area of the city and authenticated by Taxonomist in the department of Botany, Shri Shivaji Science and Arts College, Chikhli. All other chemicals were of analytical grade and used without further purification.

Preparation of the plant extracts

The bark was washed under running tap water to remove the surface pollutants and the bark was air dried under shade. The powdered bark samples were subjected to successive extraction with chloroform, methanol and acetone using soxhlet apparatus. Fresh bark material was ground using distilled water and filtered and used as an aqueous extract. The extracts obtained using solvents were concentrated using rotary vacuum evaporator and then dried. The extract thus obtained was used for various analyses.

Phytochemical screening of extracts

Chloroform, methanol, aqueous and acetone extracts were used for preliminary phytochemical analyses using standard procedures. The following qualitative tests for both the metabolites were done as follows:

a) Test for alkaloids

Wagner’s test: About 1.0 mg of bark extract was taken and few drops of Wagner’s reagent was added and the formation of a reddish brown precipitate indicates the presence of alkaloids.

b) Test for flavonoids

Shinoda test-10 mg of bark extract was added to a pinch of magnesium turnings and 1-2 drops of concentrated hydrochloric acid were added. Formation of pink color indicates the presence of flavonoids.

Lead acetate test-10 mg of bark extract was taken and few drops of 10% lead acetate solution was added. Appearance of yellow colour precipitate indicates the presence of flavonoids.

c) Test for phenols and tannins

Lead acetate test: Ten mg of bark extract was taken and 0.5 ml of 1% lead acetate solution was added and the formation of precipitate indicates the presence of tannins and phenolic compounds.

Ferric chloride test-5 mg of bark extract was taken and 0.5 ml of 5% ferric chloride was added. The development of dark bluish black color indicates the presence of tannins. Sodium hydroxide test: Five mg of extract was dissolved in 0.5 ml of 20% sulphuric acid solution. Followed by addition of few drops of aqueous sodium hydroxide solution, it turns blue which indicates the presence of phenols [3].

d) Test for carbohydrates

Fehling’s test-5 ml of Fehling’s solution was added to 0.5 mg of bark extract and boiled in a water bath. The formation of yellow or red precipitate indicates the presence of reducing power.

Benedict’s test-5 ml of Benedict’s solution was added to 0.5 mg of extract and boiled in a water bath. The appearance of red or yellow or green precipitate indicates the presence of reducing sugars.

e) Test for saponins

Honeycomb test-0.5 mg of bark extract was taken in a test tube and few drops of 5% sodium bicarbonate solution was added. The mixture was shaken vigorously and kept for 3 min. Formation of honeycomb like froth shows the presence of saponins.
Foam test-0.5 mg of extract was diluted with 20 ml distilled water and shaken well in a graduated cylinder for 15 min. The formation of foam to a length of 1 cm indicated the presence of saponins.

e) Test for glycosides
Glycoside test-0.5 mg of bark extract was dissolved in 1 ml of water and 5 ml of chloroform was added and shaken for 5 min. The appearance of pink or purple colour indicates the presence of glycosides.

f) Test for protein and amino acids
Biuret test-To 0.5 mg of extract equal volume of 40% NaOH solution and two drops of 1% copper sulphate solution was added. The appearance of violet colour indicates the presence of protein. Ninhydrin test-About 0.5 mg of extract was taken and 2 drops of freshly prepared 0.2% ninhydrin reagent were added and heated. The appearance of pink or purple colour indicates the presence of proteins, peptides or amino acids.

g) Test for anthraquinone
Borntragers test-About 0.5 gm of the bark extract was taken into a dry test tube and 5 ml of chloroform was added and shaken for 5 min. The extract was filtered and the filtrate was shaken with an equal volume of 10% ammonia solution. A pink violet or red colour in the lower layer indicates the presence of anthraquinone.

Quantitative determination of primary metabolites

Determination of carbohydrate
100 mg of extract bark was hydrolysed in a boiling tube with 5 ml of 2.5 N HCl in a boiling water bath for a period of 3 h. It was cooled to room temperature and solid sodium carbonate was added until effervescence ceases. The contents were centrifuged and the supernatant was made to 100 ml using distilled water. From this 0.2 ml of sample was pipetted out and made up the volume to 1 ml with distilled water. Then 1.0 ml of phenol reagent was added followed by 5.0 ml of sulphuric acid. The tubes were kept at 25-30 °C for 20 min. The absorbance was read at 490 nm. [4].

Determination of protein
The dried extract bark samples was extracted by stirring with 50 ml of 50% methanol (1:5 w/v) at 25 °C for 24 h and centrifuged at 7,000 rpm for 10 min. 0.2 ml of extract was pipette out and the volume was made to 1.0 ml with distilled water. 2.5 ml of 10% FeCl3 solution was added and allowed to stand for 40 min and then the mixture was thoroughly mixed and allowed to stand for another 15 min. The absorbance of the mixture was determined at 725 nm versus water blank. The analysis was performed in triplicate and the results were expressed as rutin equivalent [5].

Determination of total flavonoid content
The flavonoid content was determined by the use of a slightly modified colorimetry method described previously by26. A 0.5 ml aliquot of appropriately (2 mg/2 ml) diluted sample solution was mixed with 2 ml of distilled water and subsequently with 0.15 ml of 5 % NaNO2 solution. After 6 min, 0.15 ml of 10% AlCl3 solution was added and allowed to stand for 6 min, and then 2 ml of 4% NaOH solution was added to the mixture. Immediately, water was added to bring the final volume to 5 ml and the mixture was thoroughly mixed and allowed to stand for another 15 min. The absorbance of the mixture was determined at 510 nm versus water blank. The analysis was performed in triplicate and the results were expressed as rutin equivalent [5].

DISCUSSION

From the above remarks, it can be concluded that all the parameters of the Acacia arabica bark extract in which presence of phytochemical components of carbohydrate, protein, lipids, phenols, flavonoids and tannins.

CONCLUSION

Thus the result obtained in the present study indicates Acacia arabica bark extract have the potential to act as a source of useful drugs because of presence of various phytochemical components such as carbohydrate, protein, lipids, phenols, flavonoids and tannins. The results are very much encouraging but scientific validation is necessary before being put in to practis.
