ABSTRACT

Background and Objective: Kartagener Syndrome (KS) is a rare autosomal genetic disorder which cause a defect in the action of ‘cilia’, Swiss Physician ManesKartagener identified a cluster of symptoms in 1933 that include sinusitis, bronchiectasis, otitis etc. as well as situs inversus. A patient, Mr. K. Paul, aged 40 years of Howrah, W.B., was suffering from KS with symptoms of breathlessness and productive cough for last few years. He was treated by different generations of antibiotics and inhalation of steroid with minimal improvement. With the recurrence of the above symptoms complex, he switched over to Homoeopathic treatment on 04/10/2010 seeking better aid. Methods Confirmation of diagnosis: By HRCT Scan of Lung shows bilateral lower and middle lobe bronchiectasis, USG of abdomen and CXR show situs inversus of the organ and azospermia connotes the final diagnosis. Proper case taking and repertorization were done as per homoeopathy. Tuberculosis was the simillium of the case, and administered in 50 millisemal scale. Pre and post-lung function test by spirometry to assess progress of the disease and response to treatment. Result & Interpretation: Clinically the condition of the patient is greatly improved by treatment Lung function test by spirometry (Before treatment) – restrictive pulmonary dysfunction, FEV1 : FVC (decrease) Lung function test (After treatment) – FEV1 : FVC (increase); pulmonary function improved with comparison to earlier report. Conclusion: Nano particle laden homoeopathic medicine is capable enough to alleviate such rare disease without producing iatrogenic effect. Keywords: Kartagener syndrome, situs inversus, Bronchiectasis, Homoeopathic treatment, Spirometric response.

INTRODUCTION

107 years ago, on 8th Feb, 1904 the Berliner kinische wochen-schrift published a description, by Dr A.K. Siewert, of the patient “A.W”, who since birth had the unusual combination of symptoms of bronchiectasis and situs inversus totalis. This was the first description of what since becomes known as Kartagener syndrome (KS).

This case study is an effort to combat against KS and its complications by homoeopathic therapeutic aid.

LITERATURE REVIEW

Kartagener Syndrome (KS) is a type of primary Ciliary dyskinesia associated with situs inversus (mirror-image reversal of internal organs). KS is inherited in an autosomal recessive fashion and characterized by the triad (incidence 1:30000) situs inversus, bronchiectasis and azoospermia. Historical Data (from discovery till date

Although isolated cases had been reported by Siewert (Zivert) (1904), Oeri (1909), Guenther (1923), ManesKartagener (1933; Zurich Pulmonary Physician) was the first to call attention to the association of bronchiectasis and sinus maldevelopment with transposition of the viscera. KS is also known as immotile cilia syndrome or sitewart syndrome, Afzelius syndrome, Zivert KS triad. Camner and co-workers first suggested ciliary dyskinesia as the cause of KS in 1975. They describe 2 patients with KS who had immotile cilia and immotile spermatozoa. Later, Afzelius discovered that bronchial mucosal biopsy from patients with similar respiratory complaints showed cilia that appeared abnormal, were poorly mobile and were missing dynein arms. In 1977, Eliason and co-workers used that descriptive phrase immotile cilia syndrome to characterize male patients with infertility and chronic respiratory infections.

In 1987 Rossman and co-workers coined the term primary ciliary dyskinesia (PCD) because some patient with KS had cilia that were not immotile but exhibit uncoordinated and inefficient pattern. Current nomenclature KS includes big era of PCD. Approximately one half of the patients with PCD have situs inversus and thus as classified as having KS. Afzelius proposed that normal cilia beating is necessary for visceral rotation during embryonic development. In patients with PCD, organ rotation occurs as a random event, therefore, half the patients have situs inversus and the other half have normal situs. Strugess et al. described how the radial spoke which serves to translate outer microtubular sliding into cilia bending, was absent in some patients with PCD.

Sequence analysis of 21 genes located in the KS LINKAGE REGION on CHROMOSOME 15q.

Pathophysiology and Genetics and Molecular Biology

KS is rare ciliopathic genetic disorder that causes a defect in the action of cilia lining the respiratory tract and fallopian tube, spermatozoa. Respiratory epithelial motile cilia, which resemble microscopic hair structure (unrelated to hair) are complex organelles that beat synchronously in the respiratory tract. Normally cilia beat of 7-22 times per second, any impairment can result in poor mucociliary clearance with upper and lower respiratory tract infection. Cilia also involved in other biological processes (such as nitric oxide production) which are currently the subject of research.

Motile cilia are made up of approximately 250 proteins. KS have ultrastructural defects affecting protein in the outer and/or inner dynein arm which give cilia their motility caused by mutation on two
genes DNA I-1 and DNA H5 both of which code for protein found in the ciliary outer dynein arm.

**CLINICAL PRESENTATION**

**History**

Patients present with chronic upper and lower respiratory tract disease resulting from ineffective mucociliary clearance. A typical presentation of rhinorrhea and/or mucopurulent discharge since birth. Immotile spermatozoa result in male sterility.

**Physical**

KS is usually present with triology of chronic sinusitis, bronchiectasis and situs inversus. But otitis media, infertility may be the common associated symptoms.

**Upper Respiratory Tract**

Patient may exhibit chronic, thick mucoid rhinorrhea from early in childhood. Examination usually reveals pale and swollen nasal mucosa. Nasal polyps are recognized in 50% of affected individuals. Recurrent otitis media is a common manifestation of PCD.

**Lower Respiratory Tract**

Chronic bronchitis and pneumonia are common condition with PCD then physical examination of the patient’s chest, increased tactile fremitus, rhonchi, crackles and occasional wheeze may be present. Obstructive lung disease may another component of KS symptomatology. Bronchiectasis is the hallmark of KS.

**Other Features**

Cardiovascular examination of a patient with KS demonstrate a point of maximal impulse and the heart sounds are heard beat on the right side of the chest.

Rheumatoid arthritis, Renal abnormalities, cardiac defects, clubbing of fingers, conductive hearing loss are uncommon presentations.

**TREATMENT AND MANAGEMENT**

Medical Care (according to Modern Medicine)

Antibiotics, intravenous or oral and continuous or intermittent are used to treat upper and lower airway infection. Prophylactic antibiotics should be used with great caution in this era of emerging antibiotic resistance. Obstructive lung disease, if present should be treated by with inhaled bronchodilators. Inhaled corticosteroids are being used but no large studies support the use of these agents.

**Laboratory Diagnosis**

- Imaging Study – CXR or chest skiagram may illustrate bronchial wall thickening as an early manifestation of chronic infection, hyperinflation, bronchiectasis and situs inversus. The situs inversus strongly suggest Kartagener Syndrome (KS).
- HRCT (High Resolution CT Scan) of the chest is the most sensitive modality for documenting early and subtle abnormality within airways and pulmonary parenchyma specially to detect bronchiectatic changes.
- EGG (12lead) – shows dextrocardia with tall R waves in V1 and absent R in V6.
- Ultrasonography of abdomen shows situs inversus with spleen on the right side and liver on the left.

**Other Tests**

- Saccharin clearance test and nitric oxide (NO) test.
- Pulmonary function test (PFT) – spirometry often reveals an obstructive ventilatory defect with decreases in the ratio of Forced Expiratory Volume (FEV) in 1 sec to Forced Vital Capacity (FVC), reduced forced expired volume in 1 sec and reduced forced expiratory flow 25 - 75%
- Recent advances in genetic research have confirmed mutation of DNA H5 and DNA I1 (Geremek et al., 2004).
- Genetic testing is useful for counseling and has the potential for developing gene therapy for the management of PCD in the future.
- Primary cell epithelial cell culture can be done both gene testing and electron microscopy (EM) (Jorissen et al., 2000) in cases where the tissue and brush biopsy specimens are inadequate.
- Transmission electron microscope remains the most definitive method of establishing the diagnosis of PCD as the exact structural changes can be visualized.
- Ciliary beat frequency (Afzelius, 2004), ciliary beat pattern analysis by high speed video photography (Standard et al., 2004), and EM of ciliary ultrastructure (Teknos et al., 1997) and measurement of ciliary disorientation (Standard et al., 2004) are recommended wherever facilities exist.
- At present gene testing and EM are out of reach for many patients of PCD.

**METHODS AND MATERIALS**

This report is the review of the diagnosis and management of KS from the field of homoeopathic therapeutic perspective.

**CASE STUDY**

Mr. K. Paul, aged 40 yrs of Howrah District, W.B. came with productive cough, dyspnoea for last few years and had history of recurrent bouts of catarrhal inflammation since childhood. The patient was continuing his inhaler for bronchodilatation and he expressed his vexation for regular use of different antibiotics prescribed by pulmonary specialist. He wanted to switch over to homoeopathic medicine avoiding those drugs. The pulmonary specialist diagnosed the case as COPD and treated accordingly.

On clinical examination the positive findings of KS were detected

- Apex beat was heard over the right side of chest due to dextrocardia, S1S2 audible but no murmur.Vesicular normal breath sound, wheeze and crackles were found as added sound.
- Maxillary sinuses were tender.
- Patient was married for last 5 years but no children.
- Investigation had been done with the points keeping in the mind such as dextrocardia cough, cold, infertility and added breath sound.
- Ultrasonography of abdomen shows – situs inversus of the organ specially liver (the left side) and spleen (on the right side).
- Seminal analysis shows azospermia.
- Skiagram of maxillary sinus – shows haziness of the sinus indicative sinusitis.

Clinical presentation along with laboratory investigations connotes the final diagnosis of Kartagener syndrome. Homoeopathic case taking were done on strict principle as per guideline of Organon of Medicine and Philosophy of Homoeopathy.
Shubhamoy et al.
Innovare Journal of Medical Science, Vol 1, Issue 1, 2013, 13-18

USG showing situs invertus, liver on the left and spleen on the right

Chest X-ray showing dextrocardia and bronchiectatic changes

HRCT (High Resolution Computerized Tomographic Scan) – shows multiple small cystic lesion in lower zone of both lungs with bilateral lower and right middle lobe bronchiectasis.

HRCT scan of lungs shows bronchiectasis changes.

**Totality of Characteristic Symptoms is as follows**

- The patient desires to travel different places and he changes his profession very frequently.
- The patient’s tendency to take cold easily.
- Desire for smoked meat, fat, salty food, ice creams, aversion to bitter things.
- Fear of dogs and especially cats are marked.
- Strong sexual desire (though he is azospermic).
- The patient is chilly in thermal reaction.
- Intelligent, sensitive, irritable over daily circumstances.
- Cough, cold are aggravated by the least changes of weather.
- Rattling of chest.
- Dyspnoea with cough while lying down.

**Constitution of the Patient**
Lean, thin, emaciated (but he craves fat) fatty food and meat.

**Personal History of Tuberculosis**
At the age of 35 years old, this was treated by ATD (Anti Tubercular Drug).

**Miasmatic Background**
Predominantly psora mixed with syphilis.
Appropriate evaluation of symptoms is done on the basis of Kent’s Philosophy.
Repertorisation had been done by consulting Kent’s Repertory (Repertory of the Homoeopathic Materia Medica).
Rubric chosen from the repertory are as follows

<table>
<thead>

Innovare Journal of Medical Science, Vol 1, Issue 1, 2013, 13-18

07.03.11
No use of antibiotics till date, no use of inhaler. Dyspnoea =1, cough=1, rattling=1, sputurum production=1, pain in maxillary sinus=1, sneezing and discharge per nose=1.

06.05.11
Patient feels better. No use of antibiotics till date, no use of inhaler. Dyspnoea =1, cough=0, rattling=0, sputurum production=0, pain in maxillary sinus=1, sneezing and discharge per nose=1.

17.06.11
Patient feels better. No use of antibiotics till date, no use of inhaler. Dyspnoea =1, cough=1, rattling=0, sputurum production=1, pain in maxillary sinus=1, sneezing and discharge per nose=1.

Placebo was prescribed
Do

Spirometry done to assess improvement
FEV1 : FVC =64.78 & reversible in nature

No new attack of lung infection
Clinical improvement progressive. No use of antibiotics and inhaler

Final result from Table 2:
Prompt detection and treatment of PCD (Primary Ciliary Dyskinesia) can present its various complications (Bush et al., 2007).

Pre treatment clinical KS scoring was = 22 that means severe KS.
Post treatment KS scoring is= 05 that means mild KS.

Homoeopathic medicine Tuberculinum which is nosode in origin is capable enough to alleviate the symptoms related to Kartagener Syndrome. This result shows the symptoms of KS patient are ameliorated clinically.

Spirometric assessment are used usually for corroborative or research purpose (Bush et al., 2007). Spirometric investigation (pulmonary function test) was used as pre and post monitoring tool as a disease modality indicator. This study shows a significant change in pre and post spirometric assessment.

Before Treatment: FEV1: FVC = 48.6 and show severe obstructive defect with no significant reversibility of lung.

After Treatment: FEV1: FVC = 64.78 and show obstructive defect with reversibility of lung.
LIMITATIONS OF THIS STUDY

- This case study was greatly limited by availability of the clinical cases.
- It is limited to perform invasive diagnostic test like saccharine test, exhaled NO, ciliary beat frequency, gene testing and electron microscopy.
- It is a single study would have benefitted if more cases were added to the study the spectrum or presentation of KS and effectiveness of homoeopathic aid on KS.

DISCUSSION

KS, a rare autosomal genetic disorder could be treated by homoeopathic aid effectively. This case study shows efficacy of homoeopathic medicine, viz., Tuberculinum in 50 millisemal scale which contain Nano particle of the tubercular organism initiate a good response to ameliorate the symptoms in comparison to antibiotics of different generation and inhalation of steroid which in turn culminate an iatrogenic disease and drug resistance to the patient. In this context WHO in this year raised their voice against microbial resistance they make themes of World Health Day 2011 as "Antimicrobial – resistance no action today, no cure tomorrow".

Existing studies are done by different researchers of modern medicine, in Lancet Journal few cases (about 9 cases) are published, last case published in 2009 (VinayKapur, SandeepChowhan, Sanjay D. Cruz, Prof. AtulSachdev et al).

In BMJ (British Medical Journal) there are some few case studies are seen and in the Journal ‘Nature’ no such studies are found.

In this regard WHO have called attention to resistant microbial disorders which are a matter of serious concern for the human kind.

Thorough scrutiny of different homoeopathic periodical journal and webnet site, no case study relating with KS is found till date.
