ABSTRACT
Objective: Aims of this review were to identify actual or potential extended services performed in community pharmacy settings, perceptions among community pharmacists (CPs), general practitioners (GPs), consumers and policymakers of these extended services and barriers towards its performance.

Methods: A literature review was conducted, using Google Scholar and PubMed as a searching engine.

Results: Identifying eight quality full texts to review which fulfil the inclusion searching criteria, revealing a wide range of actual or potential extended services performed by CPs such as counselling on asthma, cardiovascular disease, breast cancer, diabetes, smoking cessation and self-medication. GPs’ perceptions towards these extended services were varied, not or in favour of CPs to perform some actual or potential extended services. Customers were in favour of CPs to perform these actual or potential extended services whereas CPs indicated a few barriers towards the performance of these actual or potential extended services.

Conclusion: As a conclusion, CPs in Malaysia were in the right position to perform the actual or potential extended services, collaborating with GPs to promote better medication use and enhance patients’ quality of life. Some barriers towards these extended services must be intervened in order to enhance the quality of the services.

Keywords: Extended services, Community pharmacist, Perception, Barrier, Malaysia

INTRODUCTION
In Malaysia, the community pharmacists (CPs) are in a dilemma as they are not given the main right to control all medication distribution [1]. Their role is shared with the general practitioners (GPs) who are also allowed to distribute medications to their patients. Even though a history in Europe had enacted the separation role of GPs and CPs back in a few hundred years ago [2], the separation role is not much changing in the developing country like Malaysia except for the practice in the hospital settings. Whereas CPs are still working under harsh environment, focusing more on health products or cosmetics or hygiene products to sustain existing in the market [3]. However, in other parts of the world, the community pharmacy practice is keeping on changing transforming the practice towards more patient-oriented, adding value to the age-old role as pharmacist [4]. For example, pharmacists are now becoming a pharmacotherapy expert, advising GPs on drug therapy plan and collaborating with them to monitor the drug therapy outcome [5]. Unfortunately, it is quite hard to see CPs in Malaysia performing patient-oriented based services and if do, there is lacking information about the services. What is going on in the community pharmacy settings? Do CPs perform any extended services instead of selling health products? What are the perceptions of these extended services? What are the barriers towards these extended services? Therefore, the aims of this review are to observe actual or potential extended services performed by CPs in community pharmacy settings, view perceptions among CPs, GPs, customers and policymakers of these extended services and identify barriers towards its performance in the context of Malaysia scenario. The rationale of this review is the fact that it can highlight some ideas to CPs, customers, policymakers and other health care professionals about actual or potential extended services performed in community pharmacy settings.

MATERIALS AND METHODS
A systematic search of international literature review and studies was undertaken using Google Scholar and PubMed as an electronic database, searching for abstracts in English from January 2006 till May 2017. The search terms used were: Malaysia; community pharmacist; extended roles; extended services; expansion roles; expansion services; perception; perspective; attitudes; barriers; limitation. The abstracts were evaluated by a researcher, searching for relevant materials that fitted with the inclusion criteria as depicted in table 1. The abstracts that adhered to the inclusion criteria were assessed for full texts. Then two researchers assessed in detail the contents of each text, searching for materials that fulfil the criteria as depicted in table 1. These full texts were reflected in the present review.

RESULTS

Literature search

A total of 522 titles and abstracts were reviewed and assessed against the inclusion criteria as depicted in table 1, led to 62 titles and abstracts. These shortlisted titles and abstracts were assessed for full texts which led to 52 texts. Two researchers had rated these texts to identify inclusion criteria which led to 8 quality texts and these texts were included in this review. The flow of the searching process was depicted in fig. 1.

![Flow diagram of searching and inclusion criteria](image)

**Description of the included text**

The characteristic of the individual texts was depicted in table 2. The texts involved a cross-sectional survey with semi-structured interview (n=1), cross-sectional survey (n=4), semi-structured interview (n=1) and focus group discussion (n=2). It is noted that the texts were assessing health promotion activities in community pharmacy settings and its barriers [6]. GPs’ perceptions of CPs’ actual or potential extended services [7, 8], CPs’ knowledge and perception of actual or potential extended services [9, 10], customers’ perceptions of CPs’ roles to prevent and manage major disease [11] and GPs’ perception of integrating pharmacists into private primary health care clinics [12, 13].

**Extended services**

A total of nineteen actual or potential extended services were noted in the review (see table 3). Medication counselling [6-8, 10] and conducting smoking cessation program [6, 8, 11] were the most rated extended services. Surprisingly, it was found that CPs were noted the less paying attention to identify, prevent and resolve drug-related problem [8]. It was also noted that CPs were referring their customers to GPs [8] even though it was previously noted that the practice itself was more towards business-oriented practice. In addition, CPs were also noted to counsel their customers about major diseases such as asthma, diabetes and cardiovascular [6, 11], crossing over the age-old role as a medication dispenser.

**Perception towards extended services**

A total of twenty perceptions were noted from the review (see table 4), demonstrating a wide range of perceptions among the customers, CPs and GPs of extended services performed in the community pharmacy settings. It was noted that GPs’ and CPs’ perceptions were the most rated. It was found that GPs have poor perceptions towards the extended services performed in community pharmacy settings [7, 8]. However, GPs were noted to have favour of CPs to manage medication use among their patients and accepting referral
customers from CPs [7, 8]. This review did not identify about policy maker's perception of CPs' extended services.

**Barriers to the extended services**

A total of seventeen actual or potential barriers towards the extended services were noted in this review (see table 5). It was noted that lack of time, training, budget, confidence and poor understanding about CPs’ roles were the most rated as actual or potential barriers [6, 8–10, 12, 13]. Besides that, it was noted that customers’ health promotion activities were a unique potential barrier to the extended services [6], reflecting a trend of self-care treatment among the people. In addition, it was also noted that CPs indicated language barrier was among the barriers [10], reflecting multi-racial ethnic languages in Malaysia might have the tendency to decrease the verbal interaction between CPs and customers. Data which reflected policymakers' views about the barriers to the performance of these extended services, was not noted in this review.

**Table 3: Extended services of community pharmacist, CV=Cardiovascular; GPs=General practitioners**
Table 4: Perception towards extended services, GPs=General practitioners; CPs=Community pharmacists; PO=Patient-oriented; SC=Smoking cessation
Table 5: Barriers towards extended services

1. Shortage of pharmacist
2. No private space for counselling
3. Language barrier
4. Lack of patient's interest
5. Lack of confidence and trust among GPs
6. Poor understanding about pharmacist's role
7. Lack of budget
8. Lack of personnel
9. Gender barrier
10. No standard guideline available for offering extra services
11. Insufficient management support
12. Lack of knowledge
13. Lack of training
14. Lack of time
15. Lack of profitability
16. Health promotion activities done by consumers
17. Lack of reimbursement

**DISCUSSION**

This review reveals some actual or potential extended services performed in the community pharmacy settings and it reflects a tendency among CPs to transform their current practice towards more patient-oriented services [6-13]. Such patient-oriented services noted were face to face counselling [6-11], treating minor ailments [8], health promotion activities [6, 8] and screening for drug-related problems [8]. This review reveals that the community pharmacy practice in Malaysia is keeping on changing and moving forward as a response to the demand of the local population. Such transformation era is also consistently observed in other countries such as Australia, Jordan, China, Canada, South Africa and the United Kingdom respectively [14-19]. For example in Australia, CPs are well known for offering services such as asthma, diabetes, methadone, herbal medicines, hypertension and wound care services as an extra service [14]. In Jordan, CPs have taken the responsibilities to identify, prevent and resolve drug-related problems among those customers who consume multiple or long-term medications [15]. In China, CPs have taken initiatives to learn in detail about the philosophy of pharmaceutical care so that they can serve the customers with the highest standard of practice [16]. In Canada, CPs decide to involve in conducting smoking cessation program and screening their customers for hypertension, diabetes, dyslipidemia and sexual health problem as a part of their extra services [17]. Surprisingly, in future CPs in South Africa would be given with more exclusive right in their practice. They will be given the right to extend their services, make a similar diagnosis, prescribe specific medication to their customers and monitor the outcome of the drug therapy plan [18]. However, in a developed country like the United Kingdom, CPs were only given the right to prescribe some exclusive medications as a part of their extended services while collaborating in work with other GPs for the benefit of their patients [19]. These scenarios reflect CPs are taking the challenge to improve their practice through extended services. Nevertheless, the actual or potential extended services performed in the community pharmacy settings in Malaysia are quite lagging from other countries. However, this review reveals that CPs have potential to extend their services towards more patient-oriented [6-13], and enhance their image as a healthcare professional.

This review indicates some perceptions towards the actual or potential extended services performed in the community pharmacy settings. It is noted that GPs are underestimating CPs in variable perspectives such as lack of clinical therapeutic knowledge and skills. Therefore, GPs are not in favour of CPs to provide extra services as advising them about medication use or else. Other previous studies which are conducted in developed and developing countries are also indicating some variable perceptions towards the extended services for example. CPs are not given the image as a professional practitioner in the health care team [15]. GPs and local people are describing CPs as a businessman rather than a health care provider. As a result, CPs do not have the opportunity to provide extra services to serve the population. Main reason noted is that the extended services are not demanded by the local population. In contrast, CPs in the developed countries like Australia and the United Kingdom are in favour of providing a wide range of extended services [14, 19]. It is noted that the extended services are a part of the demand coming from their association [14] and government [19]. In addition, GPs have strong desire to perform their knowledge and skills in order to improve their current practice [14]. Besides that, CPs in South Africa believe that they should provide more extended services and take more responsibilities with drug therapy management [18]. Whereas CPs in Hong Kong decide to extend their services as a part of establishing a working relationship with other health care practitioners [20]. Believe that the extended services can benefit their customers in terms of safety and effectiveness of medication use [20]. Interestingly, CPs in Nepal believe that the extended services are a part of their strategies to improve their sales as well as overcome business competition [21]. Nevertheless, CPs in Dubai has decided to perform extra services in their community pharmacy settings because they believe that the services might have potential to benefit their customers in varieties perspectives [22]. In short, these variable perceptions noted around the world can highlight some ideas to improve the performance of extended services in the community pharmacy settings.

In this review, it is noted a wide range of barriers towards actual or potential extended services performed in the community pharmacy settings. Interestingly, the barriers are not much different from other barriers noted in other countries. For example, it is also noted that lack of time [14, 17, 19, 21, 23-26], budget [17, 19], reimbursement [14, 16, 17, 19, 23, 25, 26], training [14, 19, 20, 29], self-confidence [14, 18, 19], knowledge [14, 16, 17, 20, 21, 23, 27-30], counselling room [17-19, 23] and shortage of pharmacists [14, 16, 17, 27] are among the barriers in the United Kingdom, Australia, Belgium, Nepal, Pakistan, China, South Africa, Netherlands, Singapore, Canada and United Arab Emirates respectively. More interestingly, our review reveals a unique barrier towards extended services which has not been noted in other previous studies. It is the customers’ health promotion activities. This activity is referring to supplement-or vitamin-based products that are accessible in the market and the products do not need for GPs’ or CPs’ supervision to consume. For example, those people who involve in a multi-level health product scheme are allowed to promote and sell supplements or vitamins to their customers. Most of the time, the people are absence of clinical therapeutic knowledge and skills. Although they might attend a short course to learn more about medical issues and their health products, they are not in the right position to advise people about the medical problem. However, in this scenario, they are potentially acting as a drug expert and giving unqualified products to their customers. Unfortunately, it is believed that the customers have given their trust to them to give some advice and products for maintaining their health. As a result, it becomes a barrier towards the performance of extended services in the community pharmacy settings. It is because that CPs have to work hard to gain trust from the people to accept their services rather than seeking for unprofessional advice. In short, it is noted that there are some barriers that require for intervention before the extended services can be performed in the community pharmacy settings. Interestingly, the barriers are consistently noted around the world.

In this review, it is noted that the actual or potential extended services performed in the community pharmacy settings are consistent with the Malaysian National Medicines Policy. This policy was endorsed by the Malaysian Cabinet last October 2006, with a full-term review in October 2012 indicates all health care practitioners must make sure the medications that supplied to their patients are safe, appropriate and quality [31]. In addition, the healthcare practitioners must empower their patients in the areas of medication adherence, responsible with self-medication, storage, and self-confidence to make decisions in collaboration with other healthcare professionals [31]. The healthcare practitioners should also facilitate continuity of care and they should collaborate with each other and share patient medical and medication profile without compromising patient’s confidentiality [31]. In short, the Malaysian National Medicines Policy indicates all healthcare practitioners including CPs to play more comprehensive roles in their practice, enhance patients’ quality of life and reduce mortality rate due to medication use. Interestingly, it is noted in this review that CPs are in the right track to perform these duties to serve the people. It is noted that CPs have performed some actual extended services such as counselling their customers about asthma [6], cardiovascular [6, 11], breast cancer [9], diabetes [6], drug misuse [6], medicine [7, 8, 10], self-medication [8], smoking cessation [6, 8, 11] and weight management [6]. This scenario reflects that CPs are no longer sitting at the back of the counter and trying to avoid of interacting with the people. The fact is that CPs have come out of their box and start to interact with people in order to improve their medication use. In last, this review reveals that the actual or potential extended services performed in the community pharmacy settings are consistent with the Ministry of Health’s future plan which is improving the quality of life among the Malaysian population.

The actual or potential extended services performed in the community pharmacy settings requires CPs to enhance their knowledge and skills. It is noted in this review that GPs are underestimating CPs’ clinical therapeutic knowledge [7]. Therefore, GPs might not in favour of CPs to manage some extended services
such as smoking cessation program, order for the blood test or else [7, 8]. As responding to the scenario, GPs must know about the available advanced training for CPs who want to perform extended services For example, the Malaysian Academy of Pharmacy has been dedicated to advancing the pharmacists' roles through education, advocacy, research and services towards better pharmacy practice[32]. This constitution offers the pharmacists a wide range of knowledge and skills such as certified smoking cessation service provider, osteoporosis, oral contraceptives, understanding generic medicines, dengue and diabetes medication therapy adherence clinic. A few years back, the constitution has collaborated with the American Pharmacists Association to certify pharmacists as a specialist pharmacist in areas of ambulatory care, oncology, psychiatric, pharmacotherapy and critical pharmacy. These knowledge and skills reflect the competent of the certified pharmacists to perform the extended services. Therefore, the certified CPs should no longer be underestimated if they have the chance to perform the extended services in the community pharmacy settings. Therefore, CPs should take the opportunity to enhance their knowledge and skills, as responding to the demand of the population in Malaysia. Furthermore, it is noted that in the previous studies conducted in India and Indonesia which reveal the educational intervention can enhance knowledge, attitudes, and practice among the trained CPs who perform extended services in the community pharmacy setting[33, 34].

CONCLUSION
This review reveals that CPs in Malaysia has the potential to extend their services to serve the people. Even though there are some barriers towards these extended services, the barriers can be intervened on condition that there is a will to change among CPs as well as strong political support from the government to enhance the quality of pharmacy practice. Some positive perceptions among the customers and GPs of these extended services can encourage CPs to have the self-confidence to perform these actual or potential extended services.

LIMITATION OF THE STUDY
It is noted that some full access texts are not available until the charges to view the contents are being settled. As a result, the scenario might have a tendency to influence the quality of this review since there is lack of article to review. Therefore, it is hoped that in future the researchers will be allocated with an appropriate budget to assist them to pay for the charges to review all the available full access texts in the online internet.

ACKNOWLEDGMENT
We are grateful to those who help us to finish up this review article.
