PLANT PROFILE, PHYTOCHEMISTRY AND PHARMACOLOGY OF SPATHODEA CAMPANULATA
P. BEAUVAIS (AFRICAN TULIP TREE): A REVIEW

ABSTRACT
Plants have been used as one of the important source for treating various diseases of human beings since ancient times. Numbers of plants are mentioned in different traditional system of medicine, among them Spathodea campanulata P. Beauvais is one of the important medicinal plant. Different parts of Spathodea campanulata such as flowers, leaves, stem, bark and roots have been reported for possessing anti-inflammatory, analgesic, cytoxic, anti-diabetic and antimicrobial activity. Phytochemical screening shows the presence of various secondary metabolites like alkaloids, tannins, flavonoids, glycosides and sterols. Relevant information and literature on Spathodea campanulata from electronic databases such as Academic Journal, Google, Google Scholar, Science Direct, Pubmed and Web of Science were collected and analyzed. Available literatures evidently show that Spathodea campanulata possess a wide range of pharmacological activities that could be explained by the presence of variety of phytochemicals. The aim of the present review to provide detailed information regarding geographical distribution, phytochemicals and pharmacological properties of this plant.

Keywords: Spathodea campanulata P. Beauvais, Phytochemicals, Flavonoids, Pharmacology

INTRODUCTION
Medicinal plants play an important role in our natural wealth. They serve as an important therapeutic agent as well as valuable raw material for manufacturing numerous traditional medicines and also acts as the lead for modern medicines. The history of medicinal plants uses for treating disease and ailments is probably dated back to human civilization. World Health Organization (WHO) estimated that about three-quarters of the world's population currently uses herbs or other forms of traditional medicines to treat illness. Even in the USA, the use of plants and phytomedicines has increased dramatically [1]. The large diversity of medicinal plant species is a huge source of potentially active phytochemicals with novel structures. Approximately 119 pure chemical substances isolated from higher plants are used in medicine throughout the world [2]. Spathodea campanulata P. Beauvais is one of the medicinally important perennial plants commonly used as folkloric medicine in Nigeria. The species Spathodea campanulata belong to the family Bignoniaceae and is native to Africa. It is often used in gardening in tropical and subtropical areas, including South America [3]. The flowers are used as diuretic and anti-inflammatory, while the leaves are against kidney diseases, urethra inflammations and as an antidote against animal poisons [4]. Several phytochemical studies were performed with different parts of Spathodea campanulata including stem barks, leaves, flowers and fruits. The leaves contain saponadol, caffeic acid, other phenolic acids and flavonoids, while fruits contain polyphenols, tannins, saponins and glycosides [5]. The plant leaves reported to have antiprasmodial, analgesic, anti-inflammatory and anti-larvicidal activity. The stem bark decoction of Spathodea campanulata have been displayed hypoglycemic, anticomplementary, antimalarial and anti-HIV activity [6].

Geographical distribution
Spathodea campanulata P. Beauvais tree is native to Africa. In tropical Africa it is planted as an ornamental plant, e.g. in Cape Verde, Zimbabwe and Madagascar. It is widely grown in tropical and subtropical regions outside Africa [7]. This plant is also commonly found in India as an ornamental plant.

Scientific classification, local and vernacular names
This plant is also called as African tulip tree or Flame tree, Spathodea campanulata P. beauv is the botanical name. It is a single species of the monotypic genus Spathodea in the flowering plant family Bignoniaceae which is composed of around 800 species distributed in 112 genera [8].

Morphology of Spathodea campanulata P. Beauvais

Spathodea campanulata P. Beauvais is a large upright tree with a spreading crown (fig. 1a) and a slightly buttressed trunk (fig. 1b). The branches are thick and marked with small whitish-coloured corky spots. Younger branches vary from being almost hairless to having a sparse covering of small hairs (fig. 1c). The large leaves are up to 50 cm long, compound with 7-17 leaflets. These leaves are usually oppositely arranged along the stems (fig. 1d). The large, orange-red flowers are arranged in dense clusters (8-10 cm long) at the tips of the
branches. The reddish-orange coloured petals are also fused together and are shaped somewhat like a tulip flower i.e. tubular (fig. 1e). Flowering occurs throughout the year, but usually peaks during spring. The fruits are long, elongated capsules resemble pods (fig. 1f). When mature they split open and release about 500 papery seeds. These seeds are very light and surrounded by membranous wing [9].

**Fig. 1: Different parts of Spathodea campanulata P. beauv [10]**

**Traditional uses**

*Spathodea campanulata* is traditionally used in the treatment of various disorders. The bark pulp is used in oedemas, skin diseases like herpes and sores. In Gabon, the crushed bark and flowers have been applied to ulcers. The cold leaf infusion is used to treat urethral inflammation and bark decoction has been reported to be used to treat kidney disorders [11]. In Senegal, the bruised leaves and flowers are used in wound treatment and ulcers. The flowers are employed as diuretic and anti-inflammatory, while the leaves are used against kidney disease, urethra inflammation and as an antidote against animal poisons. Also, the leaf decoction has been used for the treatment of gonorrhoea and women’s pelvic disorders. In Ghana, the bark infusion is used for the treatment of dysentery and stomach ache [12].

**Phytochemical**

Preliminary phytochemical screening of *Spathodea campanulata* P. Beauvais revealed the presence of alkaloids, reducing sugars, carbohydrates, flavones, glycosides, and phenolic compounds [13]. Several compounds have been isolated from different parts of the *Spathodea campanulata* P. beauv (table 2).

Pharmacological activities

Molluscicidal activity

Mendes et al. investigated molluscicidal activity of hexane and ethyl acetate extract of flowers and stem bark of Spathodea campanulata P. beauv against adult and egg masses of Biomphalaria glabrata [13].

Hypoglycemic, anti-complement and Anti-HIV activities

Niyonzima et al. evaluated hypoglycemic, anti-complement and anti-HIV activities of stem bark decoction of Spathodea campanulata P. beauv. The decoction was separated into different fractions by column chromatography by using different non-polar to polar solvents and fractions were evaluated for hypoglycemic activity in mice. The most polar fraction showed a prominent hypoglycemic activity in mice. Spathodea campanulata stem bark fractions also showed anti-HIV and anti-complement activities. Anti-HIV activity was evaluated on MT-4 cell lines using MTT assay [6].

Analgesic and anti-inflammatory activity

Emmanuel and Peter investigated analgesic and anti-inflammatory activities of stem bark of Spathodea campanulata using cold, thermal and electrically induced seizures. Activities related to anti-inflammatory activity loss, was shown to be related to iron complex formation. In contrast, the antioxidant activity of bark extract was not inhibited by the previous Fe⁴⁺ complexation which was demonstrated by spectral analysis. These results suggest that the antioxidant mechanisms of Spathodea campanulata P. beauv flower and bark extracts are different from each other [23].

Anticonvulsant activity

Emmanuel et al. evaluated the anticonvulsant activity of a glycoside isolated from the leaf of Spathodea campanulata P. beauv by lipid peroxidation mechanism. Ethanolic extracts of bark and flowers showed antioxidant activity on lipid peroxidation of liver microsome induced by Fe³⁺-ascorbic acid. Bark extracts were 5 times more efficient than flower extract. Anticonvulsant activity of flower extract previously complexed with iron (40-60 μm). The results showed that the extract (250-1000 mg/kg) significantly (P<0.05) and dose-dependently provoked the pain reaction times in rats and tail flick suppression models and reduced acetic acid induced writhing. The ethanolic extract showed significant anti-inflammatory activity against acute inflammation induced by carrageenan [22].

Antioxidant activity

Heim et al. studied antioxidant activity of flower and bark extract of Spathodea campanulata P. beauv by lipid peroxidation mechanism. Ethanolic extracts of bark and flowers showed antioxidant activity on lipid peroxidation of liver microsome induced by Fe³⁺-ascorbic acid. Bark extracts were 5 times more efficient than flower extract. Antioxidant activity of flower extract previously complexed with increasing concentrations of Fe³⁺ (20-100 μm) which resulted in the antioxidant activity loss, was shown to be related to iron complex formation. In contrast, the antioxidant activity of bark extract was not inhibited by the previous Fe³⁺ complexation which was demonstrated by spectral analysis. These results suggest that the antioxidant mechanisms of Spathodea campanulata P. beauv flower and bark extracts are different from each other [23].

Antiinflammatory activity

Makinde et al. investigated the antiinflammatory activity of the extracts of the stem bark of Spathodea campanulata P. beauv on Plasmodium berghei in mice. Sun-dried stem bark material was extracted with hexane, methanol, chloroform and water. The blood schizontocidal activity of the extracts was studied in early and established infections using chloroquine as the reference drug against Plasmodium berghei. The prophylactic action of the extracts was also investigated with standard drug pyrimethamine. Both the hexane and chloroform extracts demonstrated significant activities in the 4-Day test and Rane test. The chloroform extract demonstrated some prophylactic properties. Whereas the result obtained with aqueous extracts was not significantly different from the control used in the test. Therefore the aqueous extract did not show any significant antiinflammatory activity [27].

Cytotoxicity activity

Victor et al. investigated the cytotoxic activity of the methanolic extract of Spathodea campanulata P. beauv. Methanolic extract was obtained by soaking the air-dried material in methanol for 48 h at room temperature activity and studied for cytotoxic activity by Resazurin Reduction assay against sensitive leukemia CCRF-CRM cell lines. The methanolic extract displayed IC⁵₀ value below 80μg/ml [28].

Anti-cataract activity

Adio et al. evaluated the anti-cataract activity of fresh flower bud exudates of Spathodea campanulata P. beauv against cataractogenesis using rat lenses. Cataractogenesis was evaluated through the determination of the levels of anti-oxidant parameters such as total protein, glutathione, malondialdehyde and activities of superoxide dismutase and catalase was evaluated in the lens homogenates. Exudates significantly decreases the levels of glutathione and total protein, reduction in superoxide dismutase and Catalase activities as well as an increase in malondialdehyde content were observed in cataractous lenses when compared with the normal control. Flower bud exudates of Spathodea campanulata P. beauv displayed a dose related anti-cataract activity [29].

Antifungal activity

Drika et al. isolate Iridoid glycoside (ajagul) and two phenolic derivatives (p-hydroxybenzoic acid and methyl p-hydroxybenzoate)
from the ethanolic extract of Spathodea campanulata P. beav (Bignoniaceae) roots peels. These isolated compounds evaluated against fungus Cladosporium herbarum. The Iridoid glycoside (ajugol) did not exhibit any antifungal activity against Cladosporium herbarum, while phenolic constituents (p-hydroxybenzoic acid and methyl p-hydroxybenzoate) displayed antifungal activity [30].

### Antidiabetic activity

Tanayen et al. investigated the antidiabetic activity of methanolic stem bark extract of Spathodea campanulata P. beav. The methanolic extract was subjected to serial solvent fractionation with hexane, ethyl acetate and chloroform and evaluated for antidiabetic activity using a modification of the oral glucose tolerance test. The activity result indicated that the various fractions reduced glucose-induced hyperglycemia though there was no statistically significant reduction (p<0.05). Considering the percentage reduction of hyperglycemia, the control had a reduction of 44.7%. The hexane fraction had a dose-dependent reduction 44.4% at 50 mg/kg, 48.2% at 100 mg/kg and 49% at 200 mg/kg. The ethyl acetate fraction reduced hyperglycemia by 48.5% at 50 mg/kg, 46.5% at 100 mg/kg and 42.3% at 200 mg/kg. The residual aqueous fraction reduced hyperglycemia by 67.3% at 50 mg/kg, 53.4% at 100 mg/kg and 74.7% at 200 mg/kg. Metformin the standard euglycemic agent reduced the hyperglycemia by 48% at the dose of 500 mg/kg. All the three fractions tested possessed antihyperglycemic activity and the hexane fraction exhibiting a clearer dose-dependent activity [31].

### Anti-solar activity

PatilVV et al. evaluated the UV absorption ability of flowers of Spathodea campanulata as an anti-solar agent. The flower petals were extracted with distilled water: methanol (2:5) by maceration. The UV absorption spectrum for the extract was taken in the range of 200–400 nm using double beam UV–visible spectrophotometer. The extract showed a prominent absorbance at 200–240 nm, while good absorbance at a range of 240–325 nm. The moderate absorbance was noted at the range of 310–340. The result obtained were showed the ability of extract to absorb UV radiation and the absorbance was noted at the range of 310–340. The result obtained were showed the ability of extract to absorb UV radiation and the absorbance was noted at the range of 310–340. The result obtained were showed the ability of extract to absorb UV radiation and the absorbance was noted at the range of 310–340. The result obtained were showed the ability of extract to absorb UV radiation and the absorbance was noted at the range of 310–340.

### Acute and subchronic toxicities study

Ilodigwe et al., evaluated the acute and subchronic toxicities of the ethanol leaf extract of Spathodea campanulata P. beav as an anticonvulsant drug. For the acute toxicity study, 1000-5000 mg/kg of the ethanol leaf extract were administered to rats and toxic symptoms and mortality 24 h post administration of the extract were determined. The median lethal dose (LD₅₀) of the extract was determined. In the subchronic study, 750-3000 mg/kg of the extract were administered daily for 90 d. The food and water consumption, body weight changes, as well as haematological and biochemical parameters, were determined periodically. The estimated LD₅₀ of the extract was 446.84 mg/kg. There was no mortality during the period of study but the animals showed signs of anorexia, weakness, sluggishness and significant (p<0.05) reduction in food and water intake and body weight. The effects on haemoglobin concentration, Packed Cell Volume, red blood cell and white blood cell counts were non-significant (P>0.05). The extract caused significantly (p<0.05) increases in serum liver enzymes, Aspartate Aminotransferase, Alkaline Phosphatase and Alanine Aminotransferase. These changes showed recovery after 28 d post-treatment. These results suggested that the leaf extract of S. campanulata is safe in the treatment of epilepsy [33].

### CONCLUSION

From the review of the existing work, it was concluded that Spathodea campanulata P. Beauvais has been used in the treatment of various diseases and reported to have antimalarial, anticancer, antidiabetic, antioxidant and antibacterial activities. In the recent year's traditional medicines received more attention and evaluated for its efficacy and generally, they are safe for human beings. Numerous phytochemical and pharmacological studies have been conducted on different parts of the Spathodea campanulata P. Beauvais. Further investigation to explore the therapeutic action of the individual phytochemicals and their mechanism of action can be encouraged.
